Office of Secretary.

Room 93, State House, Indianapolis.

STATE OF INDIANA, BOARD OF FORESTRY,

Indianapolis, December 1, 1906.

HON. J. FRANK HANLY, *Governor*:

Dear Sir—In accordance with the legal requirement, we have the honor to submit herewith the manuscript of the Sixth Annual Report for the Department of Forestry. It contains papers of discussion and explanation of the work accomplished by the Board in different sections of the State, of the work accomplished at the Forest Reservation and Experimental Station, Clark County, Indiana, and of the field work of the assistant, Benjamin W. Douglass.

We desire to thank you for your courtesy, ready co-operation and sincere interest in the cause represented by this Department, and assure you it is a work which is constantly advancing and becoming a most important institution, affecting as it does the whole institutional life of the State.

We have the honor to be, with great respect,

Yours very truly,

F. C. CARSON, President.

W. H. FREEMAN, Secretary.

Preface.

The advance of forestry in all its features during the past year gives promise of future success for the cause. The sentiment for a stronger forestry movement by the people of Indiana is rapidly and surely increasing. As has been the fact since the establishment of the Department, the best thinking people everywhere are giving it their candid and earnest thoughts. It but remains for the State to give its full encouragement and co-operation and forestry as a civic and economic institution with the people will become positive.

The exact extent of the accomplishments in forestry in the State are not known. Statistics taken with the best care and completeness which the Statistical Department can command fail to show anything like the actual facts. The thing most needed by the Forestry Department is a competent field assistant backed by sufficient funds to enable him to do systematic forestry work and make complete investigations in the different counties. The best work along the line of the farm wood-lot can only be accomplished by such means.

The Board under its present attainment can not give the right attention to personal systematic work in the different counties, and consequently a great amount of work in forestry which is sought to be done is either not accomplished at all or if so is poorly performed. The Secretary in addition to the office duties has personal supervision of the Forest Reservation and Experimental Station and the lecture and literary features also must be cared for by him. Something must be neglected, as one individual can not do all there is to be done and do it rightly.

A splendid field assistant is recommended by the Board to carry forward the systematic organization of forestry in the counties. The Department is surely accomplishing a good work, but no department of any kind can do the things it should as a department and the things actually required of it unless it is given the support

with which to accomplish its aims and purposes in the best manner. The growth and development of forestry in Indiana is such as to require a field assistant, and the addition of this one small feature will add an hundred fold to the completeness and effectiveness of the work being done.

It is also further suggested by the Board that it be given more power to control corporations from the destruction of shade and ornamental trees along the highways and in the cities and towns throughout the State where adequate park officers are lacking. Suitable laws should be enacted fully restraining any individual or corporation from injury to such trees and power vested in the Board to compel compliance therewith. The ruthless disregard which is being shown daily by the destruction of trees, both along the highways and on private property by corporate individuals, is conducive of mob violence. The picture shown in the frontispiece of this report is that of a row of trees along the highway, and were only spared from the ruthless lineman by the owner resorting to shotgun vigilance. Such a course for the protection of property is deplorable, yet common decency has been so outraged by such instances of vandalism to trees along the highways that it is time to call a halt.

The Board expresses its kindest appreciation of the public press for its united support of the cause of forestry. Not many contributions, however, were offered the past year from the office, but it was from a lack of time to prepare them and not from any other cause. To the public spirited citizens the Board urges the same continued thought and conduct toward the advancement of the cause as has been made manifest during the past years. It suggests, however, that less attention be devoted to foreign and experimental species of tree planting and more thought given to the planting of home trees, the success and values of which are known. Also it is further suggested that the wood-lot as herein discussed be made a subject of earnest consideration by all land owners.

STATE BOARD OF FORESTRY.

Financial Statement.

November 1, 1905, to October 31, 1906.

Report of Work Accomplished by the Office the Past Year.

The work performed in forestry by the office the past year was similar in character to that of former ones. The efforts were directed toward stimulating interest in forest preservation and systematic forest cultivation of farm wood-lots, commercial plantings on the cheaper lands, shade and ornamental tree planting; and general tree culture. These features of forestry were promoted by visits and inspections and written recommendations made for both private and corporate interests. The plans of education, as in former years, were continued by means of lectures before public gatherings and by the distribution of literature by mail and express. Less of newspaper contributions were made than formerly, from the facts as stated in the "preface" of this report. The office work the past year was confined to two principal things, the office work proper and the work at the Forest Reservation and Experimental Station. The increase in the details of these two duties of the Secretary demanded that they be given the emphasis of attention, and consequently the field work had to be attended to by correspondence for the greater part, and much of it omitted. More good forestry work would have resulted if the field work in the different counties of the State had been given the proper attention, but the office and Experimental Station would have been neglected.

Correspondence.—The correspondence of the office the past year was far greater than any former one. As in former years, inquiry was made concerning most every feature of forestry, both by individuals and corporations. Most inquiry, however, was concerning forestry for fencing post, cross-tie and shade tree plantings. Three hundred and sixteen such recommendations were made from the office. Twenty-five hundred copies of the "Fifth Annual Report" were mailed from the office to individuals upon the regular office mailing list. In addition, about one thousand copies were mailed from the office upon special request by letter, and about five

hundred copies were expressed to high schools, clubs and special individuals upon request. Indications, judging from the inquiries made of the office, are that the subject of forestry is receiving the attention of the best classes of citizens throughout the different sections of the State.

Forest Inspections and Written Instructions Rendered.—The forest tracts visited and written instructions given were about the same as in former years. Eight splendid plantings and proposed forest cultivations were visited during the past summer, and written advice made to the owners as to the methods and plan of work. These eight tracts aggregate seven hundred forty-three acres.

This amount is by no means all that was done in real forest planting and cultivation. In every county in Indiana can be found plenty of forestry operations which are being conducted by the owner upon his own plans and ideas or upon information gained from reports, bulletins and other sources. The incomplete statistics taken by the State Statistical Department show that twenty-nine counties each planted more than ten thousand trees since 1901, the time of the establishment of the Forestry Department. The total number of trees planted in the State, by the statistics taken, from March, 1901, to March, 1906, is 1,297,645, of which 200,592 were planted in Washington County. A personal knowledge of many counties given in the statistical report show the inaccuracy of the data. In many of them a single individual is known to have more trees planted than is given for the entire county, and that more than double the number of trees given are known to be planted by two individuals, and it is further known that in such counties many persons are doing splendid forestry work. What is true of many of the counties named is also true of many not named and given as planting below 10,000 trees. This incompleteness bears out the request by the Board for a field assistant to go into the different counties and do systematic work, and thus ascertain the extent and manner of the forestry work now in progress, and render a report upon the same for the benefit of the public.

Conclusion.—The increased requests made of the Department for literature, and coming as it does from the best classes of people, is evidence of the successful argumentation of the subject before

the public. The increased demands for the various expenses of the office prevented the mailing of as much literature to the addresses upon the office mailing list as was desired, but the mailing of such reports as are being published by the Department, and such as should at all times be published, are expensive when mailed in large numbers. To send them in bulk and depend upon others to distribute them is not a business way, let alone the doubt of certainty that they will be properly delivered into the hands desired for them. The office, by means of the presidents of the farmers' institutes throughout the State, has secured and formed a mailing list of 8,000 names of the best representative citizens, and representing every county in the State. To properly supply this list of names with literature at least every two years, and to carry on the regular correspondence that will be required as the work grows and develops, an expense for postage of at least five hundred dollars will result. The present office fund, one thousand dollars, will sufficiently meet the requirements of the office if the field work is provided for by other means. The present funds will not do both, even if the office as it is now organized could find the time to do the necessary field investigation and advise. The Board requests that it be given at least the sum of twelve hundred dollars to employ competent field help for at least eight months in the year to do systematic county work and report upon the same. Closer organized work among the people is needed, and, as stated before, this small addition will make the Department so much more effective. This one feature of additional employment and expense is all the Board suggests.

Report of Work Accomplished.

AT THE STATE FOREST RESERVATION AND EXPERIMENTAL
STATION, HENRYVILLE, CLARK COUNTY, INDIANA,
TO DECEMBER 1, 1905.

Improvements.—The various features of improvements began and not fully completed at the close of last year were advanced to completion, or as nearly so as could be done with the means at command, the past summer.

The roads planned from the headquarters buildings across the Reservation to connect with the public highways which extend along the southern and eastern boundaries were completed in outline and grading this last spring. They will be gone over and regraded this fall, and the proper drainage crossings constructed. It then remains to place gravel upon them to have complete driveways, and there is plenty of such material upon the Reservation. This last feature of the road-making should by all means be accomplished in the near future. Not much work, as hauling and marketing the product, can be performed during the winter months in this section of the country owing to the impassableness of ordinary roadways under slight rainy stimulus. The field cultivation work of the summer requires that the hauling be done at other seasons of the year, consequently the need of getting the roadways in good order at an early date.

The reservoir building was advanced but little the past summer. The funds needed for this work proved to be more than was asked and appropriated by the last General Assembly. Consequently, with the exhaustion of the appropriation, the work was abandoned. As stated in last year's report, that soon after this work was begun, and before completion, heavy rainfall came, and the same has been plentiful to the present time, and there has arisen no necessity for further efforts, but to anticipate future needs the reservoirs, as planned, will be completed. The esthetic influences to the Reservation will justify their completion.

The building improvements which were planned were also not advanced any during the past year. The new administration buildings planned at the northeast part of the Reservation, and

as shown in the map of last year's report, remain uncompleted. At the time of asking for and receiving the appropriation for this improvement, the Board intended the sum asked as a help to be applied in conjunction and correlation of work with the regular and other appropriations to complete the buildings, and not as a sufficient amount for the full accomplishment. It was later ascertained by a decision from the State's Attorney-General that where a specific appropriation was made that the general appro-

View of a forest cleaning now in progress at the
Forest Reservation.

priations and others could not be applied in conjunction, even if they naturally correlated. Consequently, the building was advanced toward completion as far as the means appropriated would go, and left for final completion at a future date. The convening Assembly will be asked for a sufficient sum to complete these buildings. The further building improvements, as planned at the northwest and south central parts of the Reservation, will not be attempted, because the appropriations asked for and granted by the last General Assembly were based upon the same intentions, and consequently will not be sufficient. The sums for such

improvements, four hundred fifty dollars (\$450) and five hundred fifty dollars (\$550), respectively, and made available November 1, 1906, will be allowed to revert to the State unexpended. (These features will be more fully discussed under recommendations at the close of this chapter.)

The forest cultivation was progressed to the fullest extent

View of the forest lands at the Reservation after being treated to the forest cultivation and the product all removed.

throughout the year, with the exceptions of the time from April first to August first, which time is not considered a good season to cultivate forests by trimming and cutting out, because of the fact that sprouting occurs so numerously from stumps of trees cut during active sap flow, and the same is true of cuttings made by pruning the trees. Also, timber cut during such a season sours and rots under the bark, and worms attack and destroy the wood

so vastly, much more than when the trees are cut or pruned during dormant sap or during the time from August first to April first. Beginning at this latter time (August first) the forest cultivation was constantly kept under progress. During the past year about two hundred twenty-five (225) acres have been thoroughly cultivated, and most of the product sold, and the money remitted to the State Treasurer upon the recommendation of the State Auditor. The cultivation performed the past year was of the same

A view of a specimen of the trees removed from the forests at the Reservation in applying the forest cultivation.

character as of former ones. All the trees of every kind that are so damaged by fires or other causes of past years that no future value would accrue from them are taken out; all worthless commercial species are also removed, as well as all excess trees over and above the number thought to be all the land will properly mature. The aim is to leave upon the land to grow and mature an average of two hundred (200) standard trees per acre of from three to fifteen inches in diameter. The greater part of the cultivated forest contains more than three hundred (300) trees

per acre, and but few acres contain less than 100 trees. In some places fires of former years damaged the standing trees to such an extent that the cutting out is extensive. In all such instances the vacancies will be transplanted with seedlings of standard species this fall and winter. The trees cut out are converted into whatever product they will best make, and sell for the best price. The statement of sales and receipts of products from the Reservation in the "financial report" will show the forms of material obtained from the forest cleaning. The two cuts accompanying will show the character of the forest after it has been cultivated.

The income derived from the sales of product as by the "financial statement," does not indicate the entire product obtained for the year, but simply the amount sold to October 31. There remains a minimum invoice amount of wood, cross-ties and lumber yet on hands to be sold to the value of \$361.25. It is intended that final sales of the product for the fiscal year ending October 31 will result in about \$2,100. At the time the appropriation was asked for this forest cultivation work, the wages for labor per day were estimated at \$1.25 and \$1.50, but owing to the construction of the Indianapolis and Louisville Traction Line through the vicinity, and which extends along the eastern border of the Reservation, the price of labor advanced to \$1.75 and \$2 per day, thus lessening the amount of labor which it was intended to secure for the money appropriated. Also, no market existed at hand for such class of product as was obtained, and sales depended on such demands as could be originated. Much of the material was sold at a low figure, with the aim in mind of building a market. Such has now been accomplished. A good local market in the town of Henryville for wood and rough building lumber has been established at reasonable figures for the class of material. A cross-tie market for the mixed oaks was also originated, as no market existed for such class of railroad ties in the region of the Reservation. The Traction Company were prevailed upon to use mixed oak cross-ties, and thus a market at hand was secured. A market has also been secured with steam roads elsewhere, and cross-ties will be shipped to points remote from Henryville. A splendid fuel market has been established at Chicago, Illinois, and 100 carloads of fuel have been sold at a good figure f. o. b. Henryville, and a

bond securing the transaction has been filed with the Board by the purchasers. At the present established market prices and labor a good standard acre of woodland was taken, and the following tabulated results obtained from cultivation, and by it the future outcome of the work may reasonably be anticipated:

Product and Sales—

61 first grade mixed oak cross-ties at \$0.30.....	\$18 30
21 second grade mixed oak cross-ties at \$0.20.....	4 20
8½ cords mixed four-foot wood at \$1.75.....	15 31
400 feet mixed lumber, per hundred \$1.20.....	4 80
Total.....	\$42 61

Labor Expenses—

Making 61 first grade mixed oak cross-ties at \$0.12.....	\$7 32
Making 21 second grade mixed oak cross-ties at \$0.08.....	1 68
Hauling 82 mixed oak cross-ties at \$0.06.....	4 92
Cutting 8½ cords mixed four-foot wood at \$1.00.....	8 75
Hauling 8½ cords mixed four-foot wood at \$0.75.....	6 56
Cutting logs, 400 feet per thousand, at \$1.25.....	50
Hauling logs, 400 feet per thousand, at \$5.00.....	2 00
Sawing lumber, 400 feet per thousand, at \$4.00.....	1 60
General overseership, approximated.....	2 00
Total.....	\$35 33

Net proceeds per acre, \$7.28.

The standard trees retained on the ground after being treated to the above cultivation were as follows:

White oak.....	171—average size 8 inches.
Black oak.....	104—average size 6 inches.
Hickory	186—average size 4 inches.
Chestnut oak.....	8—average size 6 inches.
Maple	12—average size 4 inches.
American chestnut.....	1—size 2 inches.
Black gum.....	3—average size 5 inches.

Total..... 485 trees.

The above items of sales and labor expenses are so conservative that future results may be assured as good. The item of fuel, however, will be better than above stated, since the contract now secured for the present year is almost, if not, fifty per cent. better than former prices obtained. It is not thought that much better figures can be secured for the lumber and cross-ties, because of the character of the product taken. No good trees are cut, and, consequently, to say the best, the material is inferior and must sell as such. Good material can be sold at good prices anywhere and by anybody, but not so with bad stuff.

The Board attempted at the beginning of the forest cultivation to secure all labor by piece contract, but after trial such will be abandoned. Under it proper attention to the matter of tree selection and stump cutting, care of timber, care of standing trees, completeness of cultivation details and general neatness and character of workmanship on the product could not be secured. Under it the amount earned per day by the employes was given more emphasis than the forestry interests. The present plan is that of employing none but the best men, energetic and honest, put them in charge of a good foreman who demands strict compliance to rules and instructions. Under this plan the forestry interests are emphasized and the financial returns are equally as good. Good men under the existing labor conditions can secure all the employment they want at a good stated salary per day, and therefore will not submit to piece contract. Men who are not regularly employed and will submit to piece contract work are not the most responsible, and thus not desired in particular scientific work. After thorough trial the former plan of employing none but the best men at a good salary per diem, to work under the direction and instructions of a competent foreman, will be followed.

The test acre itemized above must not be construed to mean an average for the woodland which is under cultivation. It is more than an average. But by it can be safely estimated the results for the future of the work in forest cleaning. The worst will fully pay all expenses of accomplishment and the better parts will return to the State a good sum in advance of the cost of doing the work.

The General Assembly will be asked by the Board to continue the specific appropriations for forest cultivation as now given. The sum asked of the last General Assembly did not cover the amount sought to be cultivated, but it returned an equal amount to the State from less than half the area intended to cultivate, which is even a better showing for the institution. A continuation of the appropriation upon the same principle, returning to the State Treasury an amount equal to that expended, for all money appropriated for forest cultivation and a good per cent. in addition. The prime forest retained upon the ground will surely pay all the State's additional investment within a quarter of a century at the farthest. Not an unfavorable comment has ever been ex-

pressed by persons familiar with commercial forestry upon the project. It is regarded by all such individuals as a splendid commercial inveselement and one of the best object lessons for which it stands—practical forestry upon the cheap lands of Indiana.

The seed planting which was in progress last fall was continued this last spring as soon as the ground would permit. In addition to the 71 acres planted, as per last year's report to December 1, five acres of walnut were planted, 200 pounds of *Speciosa Catalpa* seeds and 200 pounds of black locust seeds were sown in nursery, and eight bushels of acorns were also sown in nursery. The area occupied in this is about 18 acres. These seeds grew well. A larger per cent. of them germinated than in any former plantings, because the moisture conditions were splendid. On this latter planted area and also upon most of the area planted last fall, oats were sown this spring and permitted to mature and were harvested. The experiment may be regarded as a good thing to do in such instances where all the needed cultivation can not be given the young seedlings. In most instances of forest seed planting growth does not take place soon enough for sufficient cultivation to be given to keep down the rank weed growth the first season, and consequently many trees perish. This overcrop does not seemingly have any damaging effects upon the young trees, as they grow well under the oats crop and the weeds do not thus overcome them. The experience of this past season is such as to commend it. The plan is largely in vogue in countries of long forestry experience. The seedlings may not make as large a growth as they would if the overcrop were not grown and all the needed attention in cultivation were given the seedlings from the very start, but such can not be done on as large a scale of planting as is done at the Reservation and with the funds provided for the work. The trees, however, with the overcrop, get such a start that the following season, with reasonable cultivation, they will make splendid progress, and thus so much less expense is incurred in their propagation. Such areas as were not given to this overcrop were given two good cultivations, and results are satisfactory.

The planting contemplated this fall and which is now in progress is as follows:

Eight acres, clay upland, 620 feet elevation, white oak and hickory.

Seven acres, bottom land, 600 feet elevation, red oak, burr oak and large shellbark hickory.

Five acres, upland clay, 700 feet elevation, American chestnut.

Three acres, upland porous clay, 700 feet elevation, black walnut and American chestnut.

Three acres, upland clay, 570 feet elevation, American chestnut.

Five acres, upland clay, 620 feet elevation, mixed oaks and hickory.

In addition to this regular planting, all the fields planted in former years will be gone over and the vacancies planted with either seeds or seedlings, as is desired. This work has not progressed far enough to give the exact extent in this report, but will be continued throughout the fall, winter and spring until completed. To accomplish this work and to plant a larger nursery the following list of seeds and seedlings have been ordered and are now arriving at Henryville:

Fifteen bushels American chestnuts.

Eight hundred pounds American ash seeds.

One hundred bushels black walnut.

Five hundred pounds yellow poplar seeds.

Five sacks sweet gum balls.

Ten bushels shellbark hickory nuts.

Ten bushels white oak acorns.

Ten bushels red oak acorns.

Ten bushels burr oak acorns.

Fifty pounds American linden seeds.

Twenty pounds standard white pine seeds.

Twenty thousand American ash seedlings.

Twenty thousand American elm seedlings.

Ten thousand yellow poplar seedlings.

It is not expected that all of this stock will be secured, but most of it will and is now in transit, and with it the planting intended at the Reservation will be largely accomplished. The nurseries will also be extensively planted from the supply.

Tree transplanting was also done to the extent of the surplus supply of seedlings obtained from the excess seedlings grown in the fields from the regular plantings of former years. At the time of planting the seeds two or more seeds were placed in a hill. In

places where all came the excess seedlings were taken out and transplanted where vacancies occurred. About 450 walnut seedlings one and two years old were transplanted. Contrary to facts gleaned from reports on walnut transplanting, scarcely a loss occurred. It must be acknowledged, however, that the growing conditions the past spring were more than good. Also there were about 1,500 chestnut and 2,000 black locust seedlings secured in the same manner and transplanted with equally good success to vacancies in the regularly planted fields. This fall there were taken from the nursery 6,700 American ash seedlings, 1,000 black locust seedlings, about 1,800 Kentucky coffee-tree seedlings, 800 American chestnut seedlings, 200 Texas pecan seedlings and about 2,000 mixed oak seedlings. These seedlings were transplanted to vacancies in the fields. On all the nursery site of eight acres a regular stand of trees was retained at distances of four and five feet apart.

With the accomplishment of the plantings intended this fiscal year the aims of former years will be attained. The fields were planted with seeds of trees which are difficult to transplant, with the view that a fairly good stand of such trees as the oaks and hickories would be secured on the fields. This was then to be followed with seedling transplantings, wherever vacancies occurred, with a mixture of different species to obtain the desired mixed hardwood stand of forest for future growth. It is a pleasure to look upon the completion of this aim and purpose which was formulated at the beginning of the institution. This feature of the forestry plan will be carried forward constantly during the fall, winter and spring. Throughout the cultivated woodland the patches where the stand of trees is not sufficient will be transplanted with seedlings in the mixture desired. Also upon the bald slopes of the Knobs, where the forest fires in past years have almost completely destroyed the forest growth, the seedlings will be planted. An attempt was made to regenerate these areas by planting seeds upon them, but it only proved to be a feast for the rodents and no success came of it. It is hoped to be successful with seedlings.

The experiments being conducted in natural reforestation are most satisfactory indeed. During the fall of 1901 forest fires raged over a large portion of the area now included within the

Reservation. During the winter of 1903 parts of the burned-over area were completely cleared off, since all the trees were dead. The leaves were all burned from the ground, but the humus conditions remained perfect for growth. With the opening of the spring weather seedlings grew up thickly over the area, because the fire's burning over it had left the soil penetrable by the sun's heat and light. The growth at this time is from 8 to 12 feet in height and is made up of the oaks, hickory, maple, aspen, chestnut

A sample of the second growth jungles at the Reservation to be given cultivation treatment the coming year.

and yellow poplar. The extensive growth of the three summers is really beyond a liberal belief even to those familiar with forestry growth. Another experiment of note is that of a small field which was cleared off and planted to corn in the spring of 1900. After the acquisition of the land by the State the field was no longer tilled, and it consequently grew up with trees. The entire area is densely covered with a growth of hardwoods, most of which are oaks and hickory, though maples and aspens are plentiful. During the fall of 1904 the area was cultivated by cutting the excess and worthless kinds. At this time the trees are from 12 to 16 feet high. Cornstalks are still to be found standing among the trees.

as evidence to show the recentness of its having been cultivated in corn. The two cuts here given were taken from photographs of these two experiments. Many others similar in result could be given.

A large number of ornamental, nursery grown, transplanted trees were secured and planted along the roadways of the Reser-

View of natural reforestation on a field which was cleared and planted to corn in the year 1900, but since permitted to grow up in trees and cultivated.

vations. Two hundred and fifty American elm, 250 American ash, 250 American linden and 250 maples, of from 8 to 10 feet in height, were planted at distances of 25 feet apart on both sides of the roads in the open fields. This work adds very greatly to the appearance and will also be an object lesson in ornamental tree planting. Other species of trees will be planted in coming years, so

that all forms of ornamental trees for street and lawn planting can be observed growing, and thus the best kinds determined by example. Methods of pruning will also be practiced to obtain results.

The cultivation given the young trees growing in the regularly planted fields was of two forms, plowing in the same manner that corn is cultivated and by hoeing. In some fields the trees were plowed and hoed, while in others they were simply hoed without plowing. They were given two complete cultivations. One plan

A view of a natural forest growth upon a tract of woodland cleared off in 1901, after being burned over by fire.

seems as successful as the other. The aim sought by the cultivation was to keep down weed and other wild forms of growth that might overcome the young trees. In the fields where the soil around the young trees was kept loose and free from weeds for a short distance from the trees (8 to 12 inches) by hoeing, and the other forms of growth permitted to stand around them, the young trees seemed to do the best. The only reasonable opinion that can be given for this fact is that the other growth formed a mulch over the soil and prevented evaporation and also a forest condition of shade and protection which resulted in good to the trees and by

keeping a clear opening around them prevented them from any smothering out, as will occur where the weeds and other growths are permitted to grow up close around them. The young trees in such fields are larger and have better boles formed than those growing in the fields where more complete cultivation was performed. Those growing in the more open fields and where the most complete cultivation as to keeping the soil cleaned of all forms of outside growth seemed to grow more bushy and to cease growing earlier in the summer than the others. The only reasonable opinion to be given for this fact is that they were more exposed to the heat of the sun, nothing formed a covering to the soil to prevent evaporation, and the trees were deprived of any form of shade protection. No forest influence was thrown around them. The two accompanying cuts show an ash and walnut seedling grown in the fields. The ash is two years growth from the seed and the walnut three years growth from the seed. These show the manner of growth obtained by close planting. It has been feared by those interested in the project that trees grown in the open fields from seed would be low and bushy. Such is not the case. In each of these plantings there are about 6,000 trees and the bole forms of all of them are splendid. These plantings are four and five feet apart and in perfect rows.

It must not be inferred from the discussion of the cultivation here given that no cultivation is needed. The young trees must be given the cultivation necessary to protect them from weed and other wild forms of growth immediately around them, but it is not thought that they require the extensive and complete cultivation that an agricultural crop demands for its successful growth. The trees at the Reservation are only given the cultivation that can be performed with the means supplied, and no more. If more means were provided they would be cultivated more and better results might accrue, but the results are satisfactory with the aims, simple, practical forestry upon the cheap lands.

The outlook for the future of the Reservation seems good. The institution is a great influence in promoting the entire interests of the community surrounding it, and in a general way almost all of southern Indiana is being materially benefited by it. It has the respect of all good thinking citizens and its influence as a factor of education in forestry is very apparent. The Board trusts that its

modest requests before the coming General Assembly will meet with the kindest approval. It keenly realizes that the public must rely largely upon its statements for the facts concerning the institution, as not all can personally investigate for themselves. Instead of its being a matter of seeing and believing it becomes one

View of a black walnut three years old, from the seed
in a plantation of 6,000 trees at the
Forest Reservation.

of hearing and forming conclusions therefrom. The Board is using its best efforts in the management and experiments to ascertain the best methods and plans for simple, practical forestry for the masses, as against the overenthusiastic, scientific ideas which would at once place it upon the pinnacle of scientific technique and

wait for the masses to ascend thereto. It is the belief that the science of forestry in all its grandeur can not precede but must and will naturally develop as the spirit of forestry is formed, and when such spirit fully exists then it will be appreciated.

The one thing most sought by the Board is the demonstration of growing the known valuable commercial forest trees natural to

View of an American Ash seedling two years old,
from the seed in a plantation of 6,000 trees,
at the State Forest Reservation.

Indiana. Too much is the belief that they can not be grown to commercial sizes within a lifetime, and consequently experimental trees are being mostly planted. The Board appeals for the united support and encouragement in the cause of forestry and the Forest Reservation and Forestry Experimental Station by the citizens of Indiana.

The Farm Woodlot.

The farm forest tract is now rapidly disappearing. The rapid growth of agriculture and the advanced prices offered for all forms and species of timber has induced farm owners to rid their farms of timber, until now it becomes imperative that systematic farm forests shall be instituted, and that the same shall be inaugurated is one of the chief aims of this Department. Farm forests are most valuable to the material development of the country. They will supply the timber needed for all local uses, and to a considerable extent supply the commercial demand for manufacturing needs. They will also greatly modify climatic extremes, purify the atmosphere, and add beauty to the landscape. Further it is a thing in which all will be benefited, and in which all should join in promotion.

It is to the end that farm forests under systematic conduction will be instituted throughout the limits of Indiana that this bulletin is issued, and the suggestions herein are for the purpose of stimulating and guiding any who may seek to engage in the work, and the plans and methods are aimed to be stripped of all technical, graduated features, and of such character that any farmer with his own labor and means at hand can accomplish his own forestry work. It is not the thought that scientific methods shall be discouraged, but that it is better to have common everyday forestry first and then grow into the science. It is the thought that the farmer who plants a bushel of forest seeds and plows and hoes them after they are growing, or keeps stock from grazing in his reserved woodland, and prevents fire from burning through it, will produce more timber than if he were to attempt to follow the voluminous theories concerning scientific silviculture.

To the fullest extent possible, this Department will render assistance in all details for the farmer's forest tract, and it appeals to the landowners to give the subject their candid thought and active observance. It is the aim to have a special field assistant for the Department, whose duty it shall be to visit and counsel with all who seek help in their work.

REASONS FOR FARM FORESTS.

There exists in the minds of many that forestry is simply a fad; that it originated in the minds of individuals who loved trees as such; in other language, it was the origin of a tree crank and fanatic. Such an idea is most erroneous indeed. It may be that such persons are in existence, and that they are advocating forestry, and if so give them credit for that good feature, but not for the origin of forestry as an institution of governments. Forestry has for its origin the best thought and intellect, and for its foundation the most vital elements of welfare. It is the origin of minds capable of seeing far into the future and perceiving conditions in advance, and is based upon the elements of industrial good, climatic modifications, and for the embellishment of the landscape in all the features of ornament, drainage, erosion and fertility of soil.

THE FUTURE FOREST SUPPLY.

The future timber supply is a matter that is at this time puzzling many a wise man. The manufacturing concerns now within the State, which, because of the past abundant timber supply, have prospered and grown to be large industries, are now facing the problem of timber scarcity in a most embarrassing form. The railroad corporations are now compelled to resort to almost any device in order to find timber to supply their needs of cross-ties and construction. A moment's intelligent thinking can but clearly reveal the stringent timber condition in Indiana, and what is true of our own State is largely the situation elsewhere, except in a few remote localities where only recently civilization has spread, and in such instances the timber is being cut and used with such rapidity that a few years more will see it devastated to the same degree as in other civilized sections. The different experiments in fuel as peat, denaturalized alcohol, crude oil, and the many other devices as oils and gases for fuel, are not all the outgrowth of attempts for the sake of convenience, but, on the contrary, are the results of timber stringency for fuel.

The idea is frequently advanced that when all the timber is gone there will be substitutions that will answer the purposes. Also, there are those who say that there will be plenty of timber

to last as long as they live, and after that they do not care. In attempting a reply to these arguments there can be but the following truthful answer: It will be found impossible to substitute in the majority of uses. There is a quality about wood indispensable for use. Wood has been, and always will be, equal in demand and use to any other material, and as long as there is industry there will be a demand for wood. Because, then, that wood is indispensable, and also because it can not be manufactured, but must grow, and, further, because the present supply is becoming rapidly exhausted, the future supply can only be hoped for through and by engaging in forestry. Putting to the most wise use the present supply and growing new forests is the only and absolute way to have timber for the future. As to the individual who reasons only for his own lifetime, the sooner he gets off the earth the better for the community in which he lives.

CLIMATIC BENEFITS.

That a well arranged system of farm forests will be of great benefit to every community within the State in the matter of climatic modulation should appeal to every citizen. It is an erroneous idea to advocate that forests will within themselves be the means of producing rainfall or snow. It can only be contended for them that they may in a way accelerate the precipitation of moisture from the atmosphere. Forests are an aid in preserving the climatic equilibrium by means of preventing rapid evaporation, directing the water into and retaining it in the soil, forming a check to winds, and by influencing in the same manner as bodies of water in tempering the atmosphere as it comes in contact by passing over or through them.

EVAPORATION.

Forests, by means of their foliage, break the sun's rays from the soil, either completely or in part, and thus limit evaporation. Experiments have proven that the per cent. of evaporation is least under a forest cover and is greatest in open fields, and that a gradual increase occurs as the distance from the woods out into the open field becomes greater.

A few tests made for the purpose of determining the influence

of forest or other cover upon evaporation are here given. An experiment made in Germany in 1883 during the months of July and August resulted as follows: From 1,000 square centimeters of bare ground 5,730 grains of water were evaporated, and from the same area, and at the same time, of similar open ground, but covered with straw to a depth of two inches, only 575 grains were evaporated.

The following is a report of experiments made by F. H. King, University of Wisconsin, and in which can be found much good data along the lines of forest influence upon evaporation and general climate. The entire report is here given:

INFLUENCE OF TREE PLANTING UPON THE DUTY OF WATER IN IRRIGATION.

In the effort to discover and establish underlying principles of agricultural science and to direct agricultural practice along lines which shall be in harmony with them, thus leading more directly and certainly to higher economic returns, we stand greatly in need of an increasing body of accurately determined fundamental facts; and it is very much to be hoped that it will be more and more recognized that the development of these fields falls properly within the purpose of Government aid and work. An adequate discussion of the broad problem of how to secure the maximum duty of water in agriculture is not at present possible on account of lack of a sufficient body of well established facts; and this is especially true of that phase of the problem relating to the influence of tree planting upon the duty of water. The body of accurately determined facts regarding the influence of windbreaks of any type upon the wind movement close to the surface, and especially upon the rate of evaporation from foliage, soil, and water surfaces, is extremely small, and yet such knowledge is necessary to a proper treatment of the subject. Some general facts and tendencies have been ascertained which are helpful for a preliminary consideration of this subject.

INFLUENCE OF WINDBREAKS UPON VEGETATION.

There is no doubt but that under certain critical conditions windbreaks do exert a very measurable influence upon vegetation. In the spring of 1894 (Bulletin 42, Wis. Agri. Exp. Stations) during May and June, an opportunity was afforded to make a somewhat critical study of this subject under field conditions. There is in Wisconsin an area of some ten thousand square miles of light sandy soil or sandy loam, and upon the lighter and more sandy portions of these soils crops are occasionally very seriously damaged by the drying effect of the wind; and the fertility of the soil is much reduced by the drifting which occurs at such times. At the time in question there had been a heavy fall of rain on the 5th and 6th of May, but on the 7th it was clear and cold with a strong wind

blowing from the northwest. During this and the following days, notwithstanding the rain, the soils on many fields about Plainfield and Almond, Wis., had been badly drifted. On the morning of the 8th the drifting had gone so far, on many fields, that at both places the loose sand with which oats had been covered, whether with seeder or with drill, had been driven from the fields to such an extent as to leave the kernels entirely exposed and the plants lying flat upon the ground hanging by the roots and whipping in the wind. On the fields where the

Fig. 1. Showing protected areas of oats and clover in the lee of woods and pasture.

whipping had not been so severe and where oats stood three inches high, the oats had been cured like hay close to the ground, and even the leaves of dock sorrel were blackened and so dry as to crumble in the hand. Very many of the blades of oats, through wilting, had broken over close to the ground, presenting an appearance which suggested to the farmers that they had been cut by hand. It was at once evident, to the most casual observer of the fields at this time, that wherever a field lay to the leeward of any sort of shelter the destructive effects of the wind were either not apparent or else they had not been nearly so severe.

About three weeks after the first serious injuries had occurred a careful study was made of many fields and the results are recorded in detail in

the bulletin to which reference has been made. Some of the observations made at this time are cited here in illustration of the decisive evidence regarding the influence of windbreaks upon vegetation. A north and south road two rods wide fenced with wire, along which are scattering trees 10 to 18 feet high, together with a scanty growth of hazel, had a field of oats lying to the east which was greatly damaged; but a strip two rods wide, next to the road, appeared wholly uninjured. A field of oats lying to the east of a field of timothy, in which there was a strong growth of dock sorrel, had a strip of oats 200 feet wide next to the grass where the stand was good, while on the eastern half, thirty rods wide, the plants were entirely destroyed. Another oat field having grass on the north and west sides, and bordered by a rail fence, showed a strip of uninjured grain 100 feet wide next to the two fences and fully 200 feet

Fig. 2. Showing three fields and surroundings where oats had been entirely killed, together with areas protected from the wind.

wide in the northwest corner of the field in the lee of the two fences. In another oat field fully five-eighths of it had been so thoroughly destroyed by the wind that it was harrowed and fitted for potatoes, but a strip along the rail fence on the south side, 150 feet wide, had been allowed to remain on account of the better stand, and on this area, as was usual generally, the number of plants increased as the fence was approached. To the west of this same field there was another of timothy, and adjacent to this there was a strip of oats 200 feet wide where the stand of plants was markedly better than farther away; and the same fact was observed in an adjacent field lying to the east of a closely fed pasture free from trees and shrubs. In another field 120 rods long from north to south and 80 rods wide, seeded to oats and clover, the effect of the surroundings upon the crops is indicated in Fig. 1, where it will be seen that at a certain distance from the conditions which have influenced the temperature, humidity, and velocity of the wind, the oats had been very much injured and the clover had been entirely killed out.

In Figs. 2 and 3 the condition of crops which were observed on other fields, and the surroundings which produced these differences, are also shown.

In Fig. 2 the southeastern field is 80 rods long and 30 rods wide. Here it will be seen the oats were good along the road in the lee of the two

fences, 40 per cent. gone further away, and entirely destroyed on the eastern half. Further north the field of oats adjacent to the field of grass and with woods to the north and in the distance to the west, had a good stand of plants, being seriously injured only at the south, where the wind came through between the two pieces of woods along the course indicated by the arrow. Similarly, in Fig. 3, the influence of shelters is clearly and sharply brought about by the condition of the crops observed and there recorded. The southern field in this figure was 60 rods from east to west and 30 rods wide. It will be seen that the half of the field stretching out into the path of the free wind coming through the gap between the two pieces of woods, as indicated by the arrow, has lost all of the crop, while the stand increased toward the woods on the west and was good at a distance of 10 to 20 rods from them.

Fig. 3. Showing protection afforded to grain by woods and direction of destructive winds.

The piece of oats lying on the south side of the scantily wooded pasture was in excellent condition, and although only 15 rods wide, a very appreciable difference could be seen in the stand of clover, to which the field had been seeded, on the margin most distant from the pasture. Even fields of corn stubble having fields of oats to their leeward were observed, in three instances, to have exerted very marked effects upon the stand of grain, and in one of these fields, on one portion of the protecting corn stubble, there was a strong growth of dock sorrel. To the leeward of this part of the field the oats had been much less injured, suggesting that the effect of the humidity of the air passing across this may have been enough altered to render the wind current appreciably less destructive. Observations like these appear to place beyond doubt that, under certain conditions, at least, windbreaks do exert a very measurable effect upon the vegetation of cultivated fields.

On three other oat fields which had been seeded to clover and which were bordered on the west with fields of grass, the number of clover plants upon unit areas which had survived the effect of the wind was determined at different distances from and to the leeward of the fields of grass. The counts were made in series along east and west lines at right angles to the margins of the grass fields, and the results are given in the following table:

TABLE

Showing the Decrease in the Number of Young Clover Plants Per Unit Area With Increase of Distance to the Leeward of the Margin of Grass Land.

Distance from margin of grass. Feet.	No. of Plants. Series 1.	No. of Plants. Series 2.	No. of Plants. Series 3.	No. of Plants. Total.
Field No. 1.				
50	187	209	187	574
200	120	139	131	390
400	88	75	68	231
Field No. 2.				
100	77	73	99	249
200	55	109	113	277
400	43	78	72	193
600	67	66	56	189
800	54	54	30	138
1000	27	11	10	48
Field No. 3.				
50	377	382	371	1130
400	166	209	225	600
700	203	180	160	543

These three sets of data appear to leave little room to doubt that, in some manner, the grass fields to the windward of the fields seeded to clover did exert an influence which materially affected the stand of clover on them. In what manner this effect may have resulted will be referred to later.

INFLUENCE OF WOODS UPON THE RATE OF EVAPORATION TO THE LEEWARD.

At the time of the observations just described others were made to measure the rate of evaporation at different distances to the leeward of woods, using a form of Piche evaporimeter rendered more sensitive by increasing the diameter of the evaporating surface to 5.9 inches, thus giving an effective area of 27.06 square inches, deducting the area of the water reservoir, the latter being regulated to .1 c. c. The instrument as placed in the field is represented in Fig. 4.

Fig. 4.—Showing the form of Piche evaporimeter as placed in the field.

With a series of six of these instruments set up in a line at right angles to the margin of a black oak grove having a mean height of 12 to 15 feet, the rate of evaporation which occurred simultaneously between 11:30 and 12:30 a. m. was measured, with the results given in the next table.

Fig. 4. Showing the form of Piche evaporimeter, as placed in the field.

TABLE.

Evaporation One Foot Above the Surface at Different Distances to the Leeward of a Grove of Black Oak in a Field of Sandy Soil Recently Planted to Corn.

Distance from Woods—Feet.	Evaporation in One Hour—C. C.
20	11.0
40	11.1
60	11.3
80	11.2
100	11.9
120	12.9

These results show that until a distance greater than 100 feet is reached but little difference in the rate of evaporation was found. At 120 feet the evaporation was 17 per cent. greater than at 20 feet. Three of the instruments were next set up at 20, 40 and 60 feet, and at 280, 300 and 320 feet from the same grove and in the same field. During one hour the amounts of evaporation were as given in the next table.

TABLE.

Evaporation at One Foot Above the Surface at 20, 40, 60, and at 280, 300, and 320 Feet to the Leeward of a Black Oak Grove in a field of Sandy Soil Recently Planted to Corn.

Distance from Woods. Feet.	Evaporation in One Hour. C. C.	Distance from Woods. Feet.	Evaporation in One Hour. C. C.
20	11.5	280	14.5
40	11.6	300	14.2
60	11.9	320	14.7
—	—	—	—
Avg. 40	11.66	300	14.4

From this table it is seen that the rate of evaporation was 23.4 per cent. greater at 300 feet than at 40 feet, basing the computation upon the averages.

In another locality the evaporimeters were set up at distances ranging from 20 to 500 feet to the leeward of a piece of black oak woods where they had an average height ranging between 15 and 25 feet and were thicker on the ground. The results secured during an hour of sunshine in the middle of the day are given in the table which follows:

TABLE.

Evaporation One Foot Above the Surface of Ground in a Field of Oats at Different Distances to the Leeward of a Black Oak Grove of Trees 15 to 25 Feet High.

Distance from Woods—Feet.	Evaporation in One Hour—C. C.
20	11.1
100	14.3
200	15.7
300	18.5
500	18.3

In this series the evaporation appears to have become constant at about 300 feet from the woods and was some 66 per cent. greater than at 20 feet distant.

The effect of a scanty hedgerow was also measured. This was composed of a strip of blue grass 16 feet wide in which there were scattered black and burr oak from 6 to 8, and occasionally 12, feet high. The hedge had open gaps in it and the nearest evaporimeter was set up in the lee of a clump of six trees spanning a length of 40 feet, there being a gap of nearly equal length on either side. To the windward of this hedge there was a naked field 80 rods wide recently plowed and being planted to potatoes, and the instruments hung above the field of oats where the plants were about 4 inches high. The next table gives the results obtained.

TABLE.

Evaporation One Foot Above the Surface of a Field of Oats at Different Distances to the Leeward of a Scanty Hedgerow.

Distance from Hedgerow—Feet.	Evaporation in One Hour—C. C.
20	10.3
150	12.5
300	13.4

In this case the evaporation at 300 feet from the hedgerow was 30 per cent. greater than at 20 feet, and 7.2 per cent. greater than at 150 feet, and the results make it clear that even scanty hedgerows exert a measurable influence upon the rate of evaporation at considerable distances to the leeward.

INFLUENCE OF A CLOVER FIELD UPON THE RATE OF EVAPORATION TO THE LEEWARD.

Adjacent to the naked field behind the hedgerow just considered there was a field of clover 360 feet wide along the margin of the oats and extending 780 feet back from it, across which the wind passed in its course from the north. At the same time the last observations were made a similar series was taken to the leeward of the clover, the results being those given in the following table:

TABLE.

Evaporation One Foot Above the Surface of an Oat Field at Different Distances to the Leeward of a Field of Clover.

Distance from Clover Field—Feet.	Evaporation in One Hour—C. C.
20	9.3
150	12.1
300	13.0

These results indicate that at 300 feet to the leeward of the clover the rate of evaporation exceeded that at 20 feet 39 per cent. and that at 150 feet 7.4 per cent. Comparing the evaporation from the two adjacent areas where, as stated, the evaporimeters were similarly and simultaneously exposed, it is seen that the air coming across the long stretch of naked ground and then passing through the hedgerow, caused measurably more evaporation than did the current which had traversed the field of clover; and these results appear to be in complete accord with the observations cited regarding the stands of grain and clover to the leeward of woods, hedgerows, grass fields and shelters of other kinds.

INFLUENCE OF WOODS AND GRASS FIELDS UPON THE HUMIDITY OF THE AIR TO THE LEEWARD OF THEM.

At the same time that the several sets of observations were taken and at the same places, others were also made with wet and dry bulb thermometers of the Henry J. Green make, reading to tenth of a degree C. The results obtained are given in the following table, each value being a mean of 10 readings, which were made in regular rotation, passing from station to station of each series during the intervals of exposure of the evaporimeters.

TABLE.

Relative Humidity of Air Three Feet Above the Surface at Different Distances to the Leeward of Woods, Hedgerows, Clover Fields and Naked Soil.

Distance to the Leeward. Feet.	Mean Dry Bulb Readings. Degree F.	Mean Wet Bulb Readings. Degree F.	Mean Relative Humidity. Per Cent.
Grove No. 1.			
30	65.32	49.46	27.0
300	63.80	47.35	24.0
Grove No. 2.			
20	75.04	58.35	34.6
100	73.13	56.39	33.0
200	72.03	55.83	34.2
300	71.47	55.13	32.8
400	73.63	55.63	29.6
500	73.31	55.94	30.8
On Leeward Margin of Clover Field.			
0	52.48	43.97	48.0
On Leeward Margin of Naked Field.			
0	53.24	43.57	44.0

These four series of observations, although too limited to serve as the basis of general conclusions, are, in a general way, quite in accord with the records of evaporation which have been cited, and also in harmony with the very pronounced observed protection afforded to oats and clover to the leeward of the various shelter conditions which have been cited. To my own mind, however, the surprise lies in finding such profound differences in crop conditions associated with the observed differences in meteorological and surface conditions. It should be borne in mind, however, in considering these relations, that the meteorological observations were not made at the time the destructive work was going on; hence what differences then existed are not known. The relations which have been observed and pointed out are clearly vital to the reclamation problems of the arid and semi-arid West, and merit full investigation, especially from the standpoint of field conditions.

The very marked influence which has been observed upon the stand of both oats and clover under the conditions cited is undoubtedly, in large measure, due to the character of the soil and to the stage of growth of the crops, the wind coming at a time when the root system of the plants was yet scantily developed and very close to the surface; but the measurable differences in the stand of clover, at such long distances from the conditions which have evidently produced them, leaves little reason to doubt that crops are sensitive to such differences of temperature, humidity, and velocity of the air near the surface as must result from the conditions whose types have been considered. There can be no doubt that rows of trees along canals and about reservoirs must very materially reduce the loss of water through evaporation from their surfaces, and such observations as have been cited make it hopeful that their influence upon the loss of moisture from adjacent fields and their effects upon crops themselves may be of much greater importance, especially in plains regions; but only fuller investigations can make certain the true relations.

WIDTH OF THE ZONE INFLUENCED BY WINDBREAKS.

Newell ("Irrigation," by F. H. Newell, page 370), in speaking of the influence of windbreaks on plains, states that: "It is estimated that every foot of height of compact trees protects a rod of ground; hence a Lombardy poplar windbreak of an average height of 60 feet, properly set out, has a beneficial influence extending practically 1,000 feet to the leeward." In the cases which have been cited the rate of evaporation and the humidity of the air were measurably affected at distances having the same or perhaps a little higher order of value; but when the effect upon the crops themselves is taken as an index, the influence clearly has a wider range, there being in the case of the fields seeded to clover so strong a contrast as 183 to 48 between the distances of 800 and 1,000 feet to the leeward of a grass field, where it appears that the influence must have been exerted in some manner other than by directly modifying either the wind velocity or the humidity of the air. It appears possible that broad continuous naked fields of dry soil or sand on clear days may have a peculiar effect upon air currents sweeping across them. The dry soil or sand itself under such conditions becomes heated and tends to expand

the air lying in contact with it, making it relatively lighter than the much cooler and more rapidly moving currents above, and it may be that when these conditions are established the warm air is displaced by the heavier, cooler, and more rapidly moving air from above. Such a current from above, aside from its higher velocity, would be likely to exert a peculiarly parching influence as its temperature rises after coming in contact with the soil. Grass covered surfaces and damp soil could not be expected to have this effect in so marked a degree, and the result may be that during windy times the air moves across damp surfaces and fields of grass in a less turbulent manner, and as a consequence maintains a higher humidity, which reduces the parching effect. If, however, the turbulence of the air currents at the surface of the ground increases their parching effect, it may be asked whether windbreaks on plains may not augment the turbulence of the currents and thus, while exerting a protecting influence over a certain distance to the leeward of them, they might not lower the duty of water in the district as a whole and have a prejudicial effect upon average crop yields. Indeed, it appears quite possible that if the windbreaks were placed too far apart such an effect might be the result, but hardly otherwise. But, even if windbreaks do exert in general a beneficial effect and tend to increase the duty of water, exact observations are yet too limited to indicate whether the magnitude of such influence would be sufficiently great to make their establishment an economic investment, much less to permit an estimate to be made of what returns might be expected from such an investment. But the problem is capable and worthy of solution.

RATE OF EVAPORATION FROM WATER SURFACES.

There is already a considerable body of data accumulated in this country which indicate the magnitude of the rate of evaporation from water surfaces. A portion of this data has been obtained by measuring the loss of water from tanks floating in reservoirs or canals, but most of them show the loss from tanks three feet square or in diameter and three feet deep, set in the ground so that the rim is within 12 inches or less of the general surface. The mean evaporation during the growing season, April 1 to October 31, as indicated by the records of 19 stations located within the rectangle 103° and 121° of longitude and 32° and 43° of latitude, is .21 inches per day, 21.149 inches per 100 days, and 47.358 inches for the 214 days in the period under consideration. The minimum evaporation at any stage indicated in the records was .14795 per day, 14.795 per 100 days, 31.66 inches for the seven months; while the maximum (not including two at Wheatland, Wyo., which appear to be exceptional) was .273 inches, 27.295 inches per 100 days, and 58.41 inches, or close to 5 feet, for the seven months, at Logan, Utah. East of the Mississippi we have access to records from but five stations in the rectangle 71° to 90° longitude and $39^{\circ} 30'$ and $44^{\circ} 30'$ latitude, and the mean evaporation has been .145 inches per day, 14.533 per 100 days, and 31.1 inches for the seven months. The records obtained at Boston, Mass., and Rochester, N. Y., are from floating tanks and the mean evaporation was at the rate of 12.09 and 11.448 inches per 100 days, respectively.

In the absence of fuller data, it is perhaps permissible to assume that the ratio of evaporation at 20 feet and 300 feet from the woods, as observed with the Piche evaporimeters, is the same as would have been found from water surfaces had they been similarly placed. The mean of the three sets of observations with the evaporimeters indicates that the evaporation at 300 feet was 40.73 per cent. greater than at 20 feet. If we consider the probable saving of water by windbreaks, it appears likely that, except in the cases where the trees exclude the sun from canals or reservoirs, the 40 per cent. represents the maximum saving which could be expected from windbreaks. With an evaporation of 47.358 inches, given as the mean above, the maximum probable saving would be 18.94 inches of water from a canal or reservoir.

EVAPORATION OF WATER FROM CONTINUOUSLY MOIST SOIL.

During the summer of 1903 a soil evaporimeter having an evaporating surface of 11.7 square feet was maintained at each of four stations: Goldsboro, N. C.; Upper Marlboro, Md.; Lancaster, Pa., and Janesville, Wis. The soil surface was kept continuously capillarily saturated by maintaining a water level in the soil at about 12 inches below the surface, from which an autographic record was secured in each case. The mean evaporation, per 100 days, at the several stations was found to be 21.2, 15.3, and 18.0 inches at the four stations, respectively, given in the order above, or an average of 18.43 inches per 100 days, and of 39.43 inches for April 1 to October 31. If the mean evaporation from similarly moist soil surfaces in the arid regions holds the same relation to that in the humid region as is indicated by the relative rates of evaporation from water surfaces in the arid and humid regions, the total evaporation from a constantly moist soil would average 60.04 inches instead of 39.43 inches, the mean found at the four stations east of the Mississippi during the growing season, computed to 214 days. If five feet is the mean rate of evaporation from continuously moist soil in the West, the maximum saving through windbreaks would be, according to the observations cited, some 40 per cent. of the total, or 24 inches. It is, of course, never true that the surfaces of fields are maintained continuously as moist as was the case under which the rate of evaporation has been determined. It is true, however, that during the time water is being applied in irrigation and for some considerable time thereafter, the rate of evaporation will exceed that which has been recorded from the surfaces kept capillarily saturated from a water level of one foot below; and irrigators recognize the fact of rapid evaporation during the hot portion of the day through the notably less distance water will travel under a given head before sinking into the ground, than is the case at night and when it is cool.

COMBINED EVAPORATION FROM SOIL AND CROP.

At each of the places where the soil evaporimeters were maintained, and at the same time, an entirely similar one filled with the same soil matured ten stalks of maize. The water level in these evaporimeters, however, was maintained at 3 to 3.5 feet below the surface, instead of at one foot, and an autographic record of the evaporation was obtained.

The time between planting and harvesting averaged 120 days, and during this time the mean total evaporation amounted to 24.15 inches, or a rate of 20.13 inches per 100 days, and a total of 43.08 computed to 214 days. On these evaporimeters the mean yield of dry matter per acre was 13,881 pounds, 10,000 being a large field yield. This observed mean rate of evaporation is, therefore, likely to be some higher than for ordinary field yields under the same climatic conditions, and the indications are that the evaporation from the field surface under crop may not be quite as large as has been found from the continuously wet soil surface. It may appear impossible that such a relation as this can exist, but the probability of it being true is made clearer when it is understood how great is the reduction in the rate of evaporation from soil surfaces when a thin layer at the top is allowed to become dry, and especially if it is loose and in the condition of an earth mulch. The surface of the soil in the plant evaporimeters was maintained in the condition of a good earth mulch three inches deep, and the effectiveness of earth mulches is clearly brought out by the results given in the following table, where the mean amount of evaporation from firm and mulched surfaces of six soil types are given:

TABLE.

Evaporation from Six Soil Types During 28 Days With Surfaces Firm and Under Three-inch Earth Mulches, Computed to 214 Days—Seven Months.

Soil Types.	Surface Firm. Inches.	Surface Under Three-Inch Mulch. Inches.	Difference. Inches.
Sandhill	14.37	1.57	12.80
Selma Silt Loam.....	22.13	5.92	16.21
Pocoson	25.64	7.11	18.53
Norfolk Sandy Soil.....	31.87	5.89	25.98
Goldsboro Compact Sandy Loam.....	40.85	6.73	34.12
Norfolk Fine Sandy Loam.....	49.79	8.70	41.09

These observations were made at Goldsboro, N. C., in June and July, and they show that there is a very great protection against evaporation afforded by three-inch earth mulches; also, that there is a large variation in the loss of water from different soil types under like conditions through surface evaporation. As the data of this table were obtained during a comparatively dry period, and when the temperature was high, the rates and differences are perhaps as large as are likely to occur, on the average, in the irrigated districts of the West, under such conditions.

In another series of observations made under what must have been conditions closely similar to those of arid climates, columns of capillary saturated soil 10 feet long were maintained under a continuous draught and without moistening the surface, during 314 days where the temperature ranged between 60° and 90° F. The loss of water which occurred was only determined percentagely, but from the weights of the soils per cubic foot the total evaporation, computed to 214 days, must have been very close to the amounts in the next table:

TABLE.

Evaporation from Ten Feet in Depth of Two Soil Types Under Arid Conditions Continuously During 314 Days—Amounts Computed to 214 Days.

Soil Types	Surface Firm. Inches.	Surface Under Three-inch Mulch. Inches.	Difference. Inches.
Sandy Loam.....	2.85	2.49	.36
Heavy Clay Loam.....	6.55	4.65	1.90

From these observations, and those given in the last table, it is clear that whenever the surface of a field is protected by a layer of dry soil, whether this is firm or loose, the evaporation will be relatively small; but less from the loose than from the firm surface.

It is probable that the losses of water by evaporation from fields in the irrigated districts of the western United States range all the way between 1.57 inches and 50 inches from April 1 to October 31. If this is the case, the maximum conservation of soil moisture, through windbreaks, is likely to be found to lie somewhere between 40 per cent. of 1.57 inches and of 50 inches, or between .63 inches and 20 inches for the period April 1 to October 31.

The windbreaks themselves, of course, transpire not inconsiderable amounts of water; but when they are planted about reservoirs and along canals, laterals and head ditches, they may draw largely upon water that would otherwise be lost through percolation or seepage; moreover, the land which such windbreaks would occupy is often, in part at least, necessarily waste land unless used in this manner. But if it shall be found practicable to make the windbreaks by using fruit or nut-bearing trees so that an annual income will be realized from them, even though it must be small, the promise of a good investment along this line becomes much better.

There is no disputing the fact that mulch formed in forests by means of leaves, litter, and decayed wood, retains the rainfall. The roots conduct the water into the ground, and forest areas thus become moisture reservoirs. The soil, because of the shaded condition and the moisture in it, is at all times cooler and more equal in temperature. It, to a degree, is like a body of water in that it takes on heat less quickly and gives it off more slowly. The opposite, however, is the fact in the instance of open fields. The rainfall thereon has nothing to check and hold it. It soon flows over the surface into the streams and away before any quantity of it can be absorbed into the earth. The open fields readily take on the heat from the sun during the day, and quickly yield it up during the night, and thus open lands are constant extremes of heat and cold, and consequently, by the effects, are incentives for violent storms. Further discussion can not here be given the

effect of forests upon climate, but every law of the unequal distribution of heat from the sun to the earth's surface and the consequent results upon the expansion and contraction of the atmosphere covering the earth and thus producing violent storms is closely related. Forests beyond question moderate the climate.

ESTHETIC BENEFITS.

The up-to-date farmer is as great an admirer of the truly beautiful, and is as much concerned about the looks of his farm and farm premises as is the city property owner for his house and lawn. If every farm in a community possessed a regulated forest tract it would add as much beauty to the community as any other form of improvement that might be made from the standpoint of looks, and, so far as actual benefit to the owner, it would be of far greater value than many improvements that are made at greater cost and which yield no financial benefit in return. (This feature of the ethical value of the farm forest tract will be further discussed under the topic of farm arrangement in determining the location of the forest tract.)

The feature of erosion is a matter that in many parts of Indiana is perplexing to farmers, especially in the rolling land sections. There are but few farms which do not possess places where the soil washes badly, and not only works damage to the eroded lands, but injures growing crops in the path of the wash. It is an unsightly spectacle to see portions of a splendid farm gullied and laid waste by erosion. Trees planted in such places will hinder the washing away of the soil and obviate the spectacle.

The extent of damage by erosion is seen greatest in the drainage conditions. The unlimited removal of forests has left but small resistance to the flow-away of the rainfall. The water has nothing to hold it and conduct it into the soil, and store it for a gradual supply to the streams and springs. It speedily flows over the surface, carrying with it the soil and debris, and deposits it within the beds of streams until many former prominent creeks are now obliterated or are only a succession of stagnant pools for the greater part of the year. It has become so that the larger rivers of Indiana, formerly noted and beneficial for navigation can no

longer be used, and for portions of the year are almost dry. Any citizen of Indiana for the last quarter of a century can readily recall instances of such within his own observation.

THE LOCATION OF THE FARM FOREST TRACT.

The present woodlots upon the farms are sadly defective in many features. They are poor in the species of trees they contain, are located on the remotest parts of the farms, are in a deplorable, unsightly condition as a result of the reckless cutting of timber, fires burning through them, and the permission of grazing, and the area does not possess a sufficient stand of trees to form a mulch to keep down grass, weeds and other spontaneous growths. The tract of timber which now happens to remain is simply the culls of every kind that has escaped the market because of its quality. The average woodlot does not contain enough merchantable timber, if sold, to pay the taxes on the farm, and is the remote rubbish spot of the farm, and shows no indications of care in any form. When timber is sold or cut for the uses of the farm, no care is observed in falling the trees to save them or the younger growth. The trees are cut and slashed in every direction, and the parts of the tree not used for lumber are not cleared away to prevent injury to the growing timber, but are left in the form in which they fell. The tops and unfit parts for lumber are not made into fuel, posts or other farm use material, for which they might be used, and the smaller brush neatly piled or burned to rid the wood land from the dangers of fire, which sooner or later comes and burns through them. Stock is permitted to pasture in the woodlot constantly, and thus any new growth is grazed down, the humus is destroyed, and grass, weeds, and briars assume control of the soil, and further progress is at an end in such places.

The present farm forest is not located by choice but by accident or the result of circumstances. It is difficult to see in the present location of the wood tract on the great majority of farms any indication of a system of relationships in the arrangements of the farm buildings, orchards, drives and fields. The first settlers usually selected a high, dry location for their buildings, regardless of the position for farm arrangement, and it is not infrequent to find that though the buildings have been many times renewed

the site has never been changed. Clearing naturally began around the site selected for the house, and was extended in all directions unless hindered by boundary lines, public highways or directed prominently in some course because of fire spreading from the clearing and causing a deadening in the forest, which was followed by clearing off the burned-over region. From one cause or another, but without choice, the present farm woodlot occupies the location it does. It performs, perhaps, no function of farm protection, is a source of hindrance to the best use and management of the farm, and may occupy the best farming land. In the consideration of the farm woodlot, with a view to arranging for its permanence and the best service to the farm, it may become necessary to abandon the present timber tract and plant anew. In many instances there can be no question but that such is the thing to do, and it is now time to give the subject a sincere thought and put the same into active conduct.

To attempt to here offer a definite working plan for the location of the farm forest and general arrangement of the farm thereto would be folly. Some plans giving a partial idea of the same, it is thought, will add strength to the idea herein given, and the working plans given by Hon. George L. Clothier, Assistant Forest Inspector to the United States Department, are submitted. It must, however, not be forgotten that each individual farm will have to be the unit of consideration in the plan to be used. The plan of A's farm can not be fitted to B's unless all their parts and the purposes of the same are equal and the same. It would be the same as attempting to make the same boot fit every and all kinds of feet.

PREPARATION OF A PLANTING PLAN.

As a machine of production a farm should have a plan which provides for the best use of its every part. The woodlot or forest plantation should be in a position to contribute to the successful operation of this plan, for the trees may affect the atmospheric drainage, the wind currents, and the humidity of the air about the home. At the same time a planting plan must provide for sites which will produce the best possible growth. The arrangement of the fields and the location of the fences, private lanes, drainage systems, buildings, and farmstead should all be considered before any forest planting is undertaken.

Very rarely indeed have farmers deliberately planned the location and make-up of their forest plantations with reference to the needs, con-

venience and economy of their farms, and the relative value and adaptability of the trees to be planted. Woodlots have sometimes been so poorly located as to do actual damage to farms. Cases have been observed in the northern half of the Middle West where windbreaks planted too close to the buildings caused the drifting snow of severe winters to bury the houses 15 or 20 feet deep. In the winter of 1899 a farmhouse in the Red River Valley, North Dakota, was buried in a snowdrift for three months because a cottonwood grove had been planted too near it. In other cases trees have been planted near tile drains, which the roots clog.

It is probable that not one-tenth of American farms are being operated under any permanent system of management. Before forest planting is undertaken some such system must be adopted, however, in order to make the future existence of the forest plantations possible, for more than half the planting plans made since July 1, 1899, by the Forest Service, fundamentally affect the future management of the farms. As very few farmers are accustomed to formulating farm plans, the agent of the Forest Service, besides being called upon to give advice in matters pertaining to technical forestry, is usually drafted into this service as well. After consultation with the landholder and consideration of all the matters affected by the policy of management, he is able to bring out an orderly arrangement which will permit on the same farm the practice of both scientific agriculture and scientific forestry.

FIG. 1. Arrangement of forest plantations on a farm in central Ohio to facilitate scientific farm management.

A CONCRETE EXAMPLE.

The planting plan shown in Fig. 1 was made for a farm in central Ohio, and illustrates graphically the bearing that forest planting may have on the management of a farm. This farm in Ohio contains 375 acres, and that part of it which is devoted to agriculture is capable of earning interest on a capitalization of \$100 per acre; not a foot of it is unsuited to tillage. That part which was originally heavily timbered has all been cleared, except a blue-grass pasture of 30 or 40 acres which is occupied by the remains of the original forest, consisting of a scattered stand of declining sugar maple and beech trees. This timberland embraces the most fertile part of the farm, and interferes most seriously with the convenient and economical division of the farm into fields. If the Forest Service had advised the owner to attempt to rejuvenate the dying trees and to underplant them with expensive nursery stock, the instructions would have been implicitly followed, but such advice would have wrought a positive injury to the landholder. Instead, the planting plan advises that the forest area of the farm be reduced by clearing the only natural timber left standing, and that, instead of retaining the scattered growth now cumbering the pasture, trees sufficient to occupy half the present forest acreage be planted in such positions as to protect the farm from the severe westerly winds prevailing in the region.

The owner was therefore advised as follows:

(1) The major portion of this farm is too valuable for agricultural purposes to be devoted to forestry. The native timber now scattered over the pasture is rapidly declining, and is reduced by every hard storm. No natural reproduction is taking place, and while the land is grazed none can be secured. The location of the scattered trees in the middle of the farm would require expensive fencing in order to protect them from live stock. Thus, it is believed that the rejuvenation of the old forest on this farm is impracticable. Instead, this land, as soon as the old trees have all disappeared or been removed, should be laid out into permanent fields. As every well regulated farm, however, should possess some timber land to supply it with fence posts and to furnish shade and shelter for live stock, new plantations are recommended. The trees will take up as little room as possible, while the arrangement of the fields in rectangular blocks will greatly facilitate the use of modern machinery.

(2) The chief plantations should occupy strips of five rods wide, running from north to south. One of these strips should be planted on the western border of the farm and another crossing its center due south of the residence. A third should cut off the block extending east from the southeast corner of the main rectangular tract. In addition to these strips, it is advised that single rows of trees be planted on the division lines between the fields, so that they may be used as live posts upon which to fasten wire to form fences. (See Fig. 1.)

(3). Black walnut and hardy catalpa should be used in equal proportions for the belts, and should be planted every four feet in alternating rows, which would be six feet apart. The walnut seed should be planted two years prior to the introduction of the catalpa seedlings, in order to allow the slow-growing walnut to get a start before being crowded by the

catalpa. The nuts of the walnut should be collected as soon as ripe in the fall, and should either be stratified* in moist sand or planted immediately in their permanent site. These nuts should never be allowed to dry out after ripening. They are most easily planted while plowing, by dropping them in a furrow and covering them with the next furrow slice. If walnuts are thus planted the squirrels are not likely to find them. The ground between the rows during the following two years should be planted with corn, and should receive good tillage. This can best be done by the use of the lister. After the catalpa seedlings are introduced no more corn should be planted, but the ground should be cultivated as long as a single-horse cultivator can be run between the rows. Catalpa seedlings 12 to 16 inches tall and one year old should be used. They can be obtained from dealers for \$1.50 to \$5 a thousand. The labor of planting these seedlings may be performed chiefly by horsepower. Both walnut and catalpa should be planted in accordance with the diagram shown at the right in Fig. 1.

By consulting the illustration the reader will see that the planting plan subdivides this farm into eleven fields—eight rectangular ones of equal area and similar dimensions, and three of nearly equal area but of unlike dimensions. This division will permit the application of scientific crop rotations, the eight rectangular fields being suited to two systems of four-year rotations and the three irregular fields to one three-year rotation. The convenient shape, ease of cultivation and wonderful fertility of this farm present an excellent opportunity for the arrangement of such rotations of suitable crops.

Trees planted on the lines which separate the fields will serve as windbreaks as well as living fence posts. A method adopted by some is to plant Osage orange hedges between the fields, and every 20 feet to allow one of the trees to grow to its natural height. The remaining trees should be pruned to a height of 5 feet and kept within proper limits for a hedge. Then, if this growth proves inefficient as a fence, it can be re-enforced by fencing wire stapled to the large trees. If the Osage orange is undesirable or a hedge is not wanted, chestnut should prove a desirable tree for the fence lines. The young trees should be planted about 20 feet apart, and when they begin to crowd each other every alternate tree should be cut out. Round-headed and with sturdy trunks, these trees will form very effective windbreaks for the intervening fields. Their nuts will bring a satisfactory return for the land they occupy, and the trees which are cut out will furnish excellent fence posts. The substitution of straight woven wire fences for the old zigzag ones of rails transforms the fence lines from breeding places for noxious weeds into productive land upon which the living fence posts grow into a merchantable product.

Such a plan as this fixes the boundaries of the fields, locates the private lanes, and, in fact, forms the skeleton of any future system of farm management that may be applied to this farm.

*Stratification is a method of storing forest seeds to prevent them from drying out. The seeds are stored in alternating layers between layers of moist sand.

A MODEL PRAIRIE FARM PLAN.

In order to illustrate a model prairie farm plan made in accordance with sound principles of forestry, Fig. 2 has been prepared. This farm plan is applicable to a large region in the prairies of the Middle West, where windbreaks are necessary to the full development of the country. It assumes that the land is of uniform condition of soil, and has been surveyed by the rectangular system adopted by the government. The

FIG. 2. Ideal plan of the four quarters of a section with location of forest and wind-break plantations—suited to the prairies of Kansas and Oklahoma.

public roads are supposed to be located on the section lines. The application of this model to a country with its surface broken by creeks or lakes would, of course, necessitate a modification to fit local conditions. The plan is intended merely to illustrate principles.

Four farms of 160 acres each are shown, illustrating an arrangement suitable to each of the four quarters of a section. The farmstead, or that portion of a farm which is occupied by the residence, barn, orchards, gardens, lawn and feedlots, is here shown as placed at the section corner of each farm. While in a large proportion of cases the location of the farmstead will be determined by the particular conditions, as water supply,

topography, etc., an arrangement, where practicable, by which the houses stand on the section corners will be worth considering.

The fields on each quarter section have been laid out to permit the planting of windbreaks to protect the crops from the hot southwesterly winds of summer and the cold northwesterly winds of winter. The farmsteads are also provided with protection from winds. East winds have not been considered, because of their infrequent occurrence, but a general adoption of this plan on all the farms of a region would afford protection from all points of the compass.

The fields, with one exception, are all of the same shape and size, there being on each quarter section six fields, each 22.1 acres in area. This method of dividing the farm into fields will afford an opportunity for the application of a scientific system of crop rotation, and the fields, being six in number, will permit the application of a compound rotation embracing the use of a perennial crop like alfalfa in combination with five annual crops, where this is desired. If the use of a perennial is not desirable, the six fields will permit the running of two parallel three-crop rotations.

THE AMOUNT OF FOREST FOR THE FARM.

The question, what fractional part of a farm should be retained in forest? is frequently asked. To give a definite reply would not be wisdom, because the conditions in all instances of State and communities are not the same. More forest may be required in one locality than in another. Every effect and need would have to be known to make a positive assertion in answer to such an inquiry. Lincoln was once asked, by some able theorists who were discussing the perplexing problem of just how long a man's legs should be in order that he be the best physical type of soldier, for his idea. Without ceasing the duties in which he was engaged he replied, "I have not thought of the matter, but should judge they ought to be long enough to reach the ground." As near a positive answer as could at this time be made after careful study is that the fractional part should be large enough to supply every demand for wood upon the farm and a surplus for commercial demands besides. At the present prices for building lumber, the farmer who has disposed of all his timber and is required to buy for his building and fencing is far the loser, but the farmer who has been wise enough to save his trees sufficiently either for his own building and fencing and for commerce is exceedingly the gainer. The tract should be large enough to supply all building lumber, fencing and fuel and to yet have a good reserve for the local commercial demands. The area reserved should also be put to its

fullest producing capacity, and whatever fractional part estimated should be based on a full stand of growing trees.

By some the fractional part of the land which should be reserved in forest is given at one-eighth, by others as one-tenth. Some countries of Europe have laws requiring these fractional allotments for forestry of landowners. It would seem that in the best agricultural sections that a fair fractional estimate would be from one-twelfth to one-sixteenth of the land and in the hilly, broken sections of the country, where the land is not well suited to farming, that the area devoted to forestry should far exceed this amount. As without question broken land is far better and much more profitable when devoted to forest and fruit growing. An estimate of one-half to one-sixth would not be too large.

TREES TO PLANT IN THE WOODLOT.

Whatever may be the diversity of opinions as to what trees are best to plant for the various special uses as advocated by individuals supposed to be authority and experienced in such particulars, all will agree that the woodlot in Indiana can be planted to no better kinds of trees than those natural to the woodlands throughout the State. No more valuable trees could be introduced, considered from every viewpoint, than the white, burr and red oaks, American ash, black walnut, shellbark hickory, yellow poplar, wild cherry, American elm, sycamore, maple and linden. For fencing posts, cross-ties, telegraph and telephone poles the American chestnut, black locust, catalpa speciosa, osage orange, mulberry, Kentucky coffee tree and red cedar are the recognized trees to plant. The woodlot should contain a mixture of these two classes of trees, as the problem with the farmer now, and will be in the future, is lumber for building, posts for fencing, and wood for fuel, and in the field of merchandise one is sought as extensively as the other. The farm forest should be free from worthless species and trees of experiment should be given no room and time. Let the experimental stations develop all such doubtful points as growing trees, the character and quality of which in this country are unknown and doubtful.

METHODS OF PROPAGATION.

The method employed in the establishment of a permanent woodlot may be any of many, and whatever the one selected, it will result successfully if assiduously followed. The result of anything attempted and accomplished can not as much be attributed to the method of procedure as to the soul put into it by the undertaker. True a wrong method could not result in the best, no matter how much soul injected, but more will result from a poor method backed up by the ardent devotion of the performer than from a good method lacking any confidence and support. The heart and hand determinedly united in an effort, and a plan of action based on common-sense judgments, will result in success.

The methods here discussed are those now in vogue throughout the country in conducting forestry operations by students of the forestry profession, and the results where followed are good.

Regeneration of Old Forests.—In Indiana the problem of regenerating old forest woodlots is not surrounded with the difficulties of other sections of the country. The soil of our State is naturally a tree growing one. Wherever natural forest conditions are found a dense growth of trees prevail. Wherever unnatural forest conditions occur and the same are obviated a good growth of trees succeeds. The soil of Indiana by nature was covered with forest trees and its tendency is to return or remain so. Thus the first prime element, tree growing soil, is natural. The climatic conditions are not, however, the best, owing largely to the fact of the changed soil covering caused by clearing off the forests. This changed condition has an influence as given under the preceding topic, "Climatic Benefits."

If a woodland retains its forest conditions of humus and is free from sod growth, regeneration is an easy task. By simply keeping stock from the area desired to reforest, and preventing fires from burning through the woods, a few years will develop a dense undergrowth of trees. If the area possesses the reverse conditions because of having long been used as a pasture land, then the process is a different one. Also if the old forest consists largely of low spreading beech, the problem requires a different consideration.

Where a woodlot has been used as a pasture land until the

humus is destroyed and a dense sod formed, the process giving the best results is as follows: Thoroughly break up the sod in some convenient manner, as plowing or permitting hogs to root it up, which they will do if given the opportunity, because of herbs, roots

A view of the average farm woodlot where stock has not been permitted to graze the past summer, and showing the natural growth of young forest trees springing up.

and insect and worm life under the sod, which they desire as food. The plowing, if decided upon, may be performed during the late fall and early winter, after the busy season is past. It should be performed at such time so that the winter's climate and changes will completely disintegrate the soil and sod and restore the ground

to a fit condition for seed without labor. Usually when a woodland is so treated and all stock is removed a dense growth of trees spring forth from the seeds that have been lying dormant beneath the sod and waiting for liberty. This method can be greatly aided, however, by scattering on the surface, after the plowing is done, seeds of the kinds of trees most desired. The winter's action on the soil will cause them to become sufficiently imbedded to take root and grow as soon as spring returns and new life begins. The

View of a farm woodlot in which stock has been permitted to graze constantly, showing no young growth of trees springing up.

seeds of whatever kind desired can be secured during the autumn and stored in a cool, dry, airy room in anticipation of the work.

Should the trees of the old woodland be mostly large, low-spreading beech, the first step should be to remove them, since the dense shade afforded by them does not permit of growth under them, and the denseness of their foliage is such as to stunt any growth in the path of their shade. Masses of all kinds of winged seeds which are carried by the breezes drift and lodge under them and when they are removed so that the sunlight and heat can penetrate the soil, usually a dense growth of ash, maple, elm, poplar and such

trees which possess seeds that may be carried in the air grow up at once. A growth of hickory, oak and walnut may be secured by scattering seeds as described above.

These methods followed in the regeneration of old woodlots will result in success beyond the expectation of most persons, especially those who have not given the subject proper thought.

Either of these methods employ different processes of operation. The whole area may be gone over at one time or season, strips may be gone over season after season until the whole is completed or patches throughout the area may be treated and these enlarged year after year until they converge and thus cover the area. These processes are known respectively as the "compartment," the "strip" and the "group" systems of regeneration.

By the "compartment" plan the whole area to be regenerated is seeded and cultivated in the same seed year, but it entails difficulties which only the most perfect conditions could obviate.

Under the "strip" plan the regenerative process is conducted over strips instead of over the whole area to be cultivated. The strips are treated so as to have three receiving attention at the same time; one being in the completed stage, one in the stage of seeding, and one in the stage of preparation. The breadth of the strips is determined by the influences under which the owner is acting. The operations should be begun on the most permanent side and extended one after another till the whole tract is treated. In this manner the work will be performed and different stages of timber will be growing.

The "group" system may be viewed as a modification of the "strip" system. Under its workings different patches are regenerated at intervals over the forest area and these are then enlarged by the same three stages of operations till they converge, and the whole area is thus regenerated. The main objection to this system is the unevenness of forest it produces. It is one of the most convenient means where good seed trees exist to spread out from them. In almost every forest some good trees are standing which may be made nuclei for regenerating. It is a good plan where the varieties are desired in groups as opposed to a general mixture.

Many considerations which should receive the most careful study enter into these regenerating processes. The porosity, moisture and humus are factors which the soil itself must possess in

right relations. The climate and denseness desired are other important features. It may require much artificial assistance to get these relations in accord. In cases of too much humus and rubbish the same must be removed before the seed is sown. If the humus is deficient the soil will have to be worked by such means as hoeing, plowing or harrowing. In cases of sod the same course must be pursued. If too much shelter exists trees should be removed until the proper shelter and light are secured. Good conditions exist when enough shelter is obtained to prevent weed and sod growth and the soil is seen in half mixture with humus. When such conditions prevail the seed will sink readily into the soil and the roots of the germinating seeds can penetrate for sustenance. It is advisable to at all times, for seed planting, prepare the soil by working it.

The cutting of timber preparatory for this regeneration of forests consists in removing all trees except such as are retained for seeding and to properly shade the ground. The successive cuttings will be determined in frequency by the size of the timber to be marketed or used. When once the forest has been regenerated so that trees for seeding properly may be retained over all parts of the tract, the idea in the "compartment" system can be executed very well.

If the plans are followed, and good seeds from the best varieties of valuable trees are secured and planted, the woodlot will be all that is desired and the whole country will be more valuable and beautiful.

In regenerating the woodlot, or in the planting of new areas, roadways should be left at intervals for getting into the forest for the removal of timber when desired. It will be found beneficial to do so.

How to Grow Young Trees For Forest Planting.

BY E. A. STERLING,

Assistant Forester, in charge of Forest Extension, Forest Service.

THE FARMER'S NEED OF A HOME NURSERY.

Forest planting by small landowners is an important line of forest work, and in many sections of the United States is a recognized adjunct to successful agriculture. It had its beginning long before forestry became a subject for general economic consideration, and the settlers of the Middle West planted trees for years before there was a professional forester in this country or recognition of the subject by the National Government. The results are now apparent in the form of planted groves and windbreaks of mature trees in many regions, particularly in the prairie States. In Nebraska alone the average of the returns of the assessors for 1903 and 1904 showed an area of 286,000 acres of planted timber. Many mistakes were made by the early tree planters, and much of the timber now standing is of little commercial value, because the primary desire was for quick effects, which were secured by using rapid-growing species of poor quality and short life. From the standpoint of protection very satisfactory results were obtained, but in future planting the use of trees which will not only serve for protective purposes, but also produce timber of higher value for posts, fuel, and lumber, is strongly urged.

The farm windbreaks and shelterbelts and the small planted groves which furnish fuel, fence posts, and repair and construction material constitute one of the less striking phases of American forestry today. Considered, however, from the standpoint of the greatest good to the greatest number, their value to the vast host of citizens who follow agricultural pursuits becomes apparent, and their contribution to the prosperity of the West is realized.

Practically every section of the country can be helped by more intelligent and extensive forest planting by small landowners. By

this means the abandoned farms of New England can be made productive, the best kinds of shelterbelts and woodlots secured in newly irrigated sections, the needed protection given to field crops and the necessary wood material produced cheaply on the treeless plains and prairies, and the whole country made more attractive as a place of habitation. With the development of the semiarid West through the reclamation of large areas by irrigation and dry farming, an entirely new field for forest planting as a farm crop is opened up. One of the functions of the Forest Service is to encourage this work by determining the species most suitable for every situation and region, and by giving advice as to the most economical and effective methods of planting and protecting the young trees.

One of the most potent influences which retard forest planting on farm lands is the difficulty experienced in securing suitable planting material save at almost prohibitive cost. Until recently very few nurserymen attempted to raise forest tree seedlings, and the demand was so uncertain that high prices were charged as an offset to the uncertainty attendant upon the disposal of the stock. The high initial cost of nursery-grown seedlings, the expense of shipment, and the uncertainty of receiving the young trees when wanted have had a very discouraging effect on the small planter, and the establishment of plantations has been curtailed in consequence. On the other hand, home production of young trees has seemed too difficult a task for the novice; while the rush of farm work at the time seed beds should have the most attention, together with the lack of reliable information as to how to grow forest seedlings, has generally checked all efforts along this line.

It is the object of this paper to show that it is not difficult or impracticable to grow the young trees needed for ordinary farm planting. If a corner of the garden is devoted to this purpose, and as much care and attention is given to the work as is necessary for the successful production of common garden truck, there is no reason for failure.

The suggestions here given are intended to apply only to the production of young trees for home use, and by the simplest methods which will insure success. The use of home-grown nursery stock should greatly reduce the initial cost of a plantation, whether it be

composed of 500 or 50,000 trees, and should result in more extensive forest planting on the waste places on farms, and in general for purposes of protection and wood supply. The care necessary to grow successfully young trees for planting, and the time required, which is one year for broadleaf trees and two or three years for evergreens, are more than compensated by the saving in cost and the better results secured.

COLLECTION, PREPARATION AND CARE OF SEEDS.

The fundamental step in growing young trees is to secure good seeds of the species desired. If fruiting trees are close at hand, the seeds may easily be collected; otherwise they can be ordered from seedsmen for delivery when needed in the spring. The short-lived seeds of silver and red maple, elms, willows, and river birch, which mature in the spring, are rarely handled by dealers, and should be collected promptly when mature and planted at once. The fruit of all other important species ripens in late summer or fall, and, with the exception of the aspen and cottonwood, may be preserved over winter.

The short-lived seeds can best be collected by catching them in sheets or blankets as they fall, or by sweeping them up from the ground. Acorns and nuts can easily be gathered from the ground, while pods, seed-balls, cones of all kinds, and fruits of the cherry, hackberry, and ash can be most easily secured by picking from the trees when mature. All acorns from the white oak group should be collected as soon as they fall, for they will soon germinate if left on the ground. In collecting, care should be taken to gather seeds only from vigorous, well-formed trees, and to be sure of the identity of the species. This is essential, particularly in the case of catalpa, because the hardy catalpa (*Catalpa speciosa*) is the only form worthy of propagation, yet it is hard to distinguish it from many hybrids. In case of doubt, specimens of seeds should be sent to the seed-testing laboratory of this Department, where they will be identified and their vitality determined without charge.

With many species some treatment is necessary in order to separate the seeds or nuts from their covering. The hulls of the hickories may be removed readily when the nuts begin to dry; walnuts may be run through a corn sheller or forced through an

auger hole when green to free them from the thick shuck, or they may be placed in piles until winter to allow the shucks to rot; the seeds of pulpless pods, such as the black locust and catalpa, should be shelled out by hand when dry; the fleshy fruits of honey locust, Osage orange, mulberries, etc., require macerating in water until the seeds are separated, after which they should be spread in thin layers and dried slowly. The thin-scaled cones of ever-green trees and of the yellow poplar (tulip tree) and birches open readily in most cases upon drying. The cones should be spread on a smooth surface in the sun or in a warm room, and, when open, the seeds may be shaken out and the cones removed. In the case of firs, yellow poplar, and birches, however, the cones fall apart when dry. A few of the pines, as the jack pine, pitch pine, knobcone, and others, have cones which will not open without artificial heat, but they rarely come into consideration in a home nursery. In separating seeds from the scales, wings, or dirt with which they may be mixed, a sieve can be used, and in many cases light dirt may be removed by pouring the seeds from one receptacle to another in a current of air.

The seeds of nearly all species are better for a little careful drying after they are gathered or extracted, to remove all superficial moisture. This is preferably done in a cool, airy place where the seeds can be spread in thin layers and stirred frequently. An earthen floor is the best place for nuts and acorns. Since weevils are very destructive to most nuts and acorns, all seeds of this kind should be treated with carbon bisulphid before being put into winter storage.

Upon the care given to the winter storage will largely depend the vitality of the seeds in the spring. The pines, spruces, larches, firs, cedars, birches, mulberries, locusts, Osage orange, black cherry, and catalpa should be stored in sacks hung in a cool, dry place away from mice and rats. All acorns and nuts should be layered, or "stratified," in sand, preferably in a pit out of doors, where they will be subject to thawing and freezing. Good drainage is absolutely essential. The best plan is to dig a pit about 18 inches deep, place 5 or 6 inches of coarse sand or gravel in the bottom, on this spread a layer of nuts not to exceed 3 inches in depth, and then fill in above with leaves, chaff, or straw, with 6

or 8 inches of dirt on top, well rounded so as to shed water. If mice or squirrels are likely to disturb the nuts, the sides of the pit should be lined with boards. The smaller seeds, such as sugar maple, hackberry, boxelder, red cedar, coffeetree, yellow poplar, and ash, can also be kept most safely by layering in sand, although they will retain much of their vitality if kept in a uniformly cool, dry place. If stored in sand, it should be in boxes, either in a cellar or in a cool outbuilding.

THE TIME TO PLANT.

Nursery planting should ordinarily be done in the spring. The exact time varies with the location and season, but a good rule is to plant the tree seed when the soil and weather conditions are such as would be favorable to the planting of early vegetables.

TWO KINDS OF NURSERY REQUIREMENTS.

The forest trees adapted for farm planting fall into two groups which require very different methods of nursery treatment. The first group is composed of conifers, or evergreens, which must be grown in partial shade, left in the seed beds two years, and preferably once transplanted to open nursery rows before they are set in their permanent places; the second comprises the broadleaf or deciduous trees, which may usually be grown without shade and set out permanently the first spring after planting, when they are one year old.

Each of these groups will be treated separately, and the suggestions made general to cover as nearly as possible the wide range of country and the varied conditions under which planting is advisable.

CONIFEROUS TREES.

Under this head the trees which would ordinarily be grown for forest planting are white, red (Norway), pitch, jack, Scotch, western yellow (bull), Monterey, and Coulter pines; white, red, Colorado blue, and Norway spruces; European larch; arborvitæ; and balsam and red fir (Douglas spruce). The nursery methods outlined would apply as well to the less commonly used species.

THE NURSERY SITE.

In the selection of a nursery site it should be the aim to have a convenient location where there will be no danger of disturbance by stock or birds, and where the soil is a moderately fertile sandy loam, well drained and as free as possible from weeds. For a nursery with a productive capacity of a few thousand seedlings there is seldom a better location than a section of a vegetable garden. If the ground is lacking in fertility or is covered with sod, it should be enriched and thoroughly worked, as for a garden site. Knowing the number of young trees desired, the area necessary can be roughly approximated by figuring on 3,000 seedlings per 100 square feet of ground, the assumption being that about half of this total space will be covered by seed beds, the other half by walks and paths. In nearly all regions it will be found convenient to have the nursery near a windmill or other source of water supply.

SIZE AND PREPARATION OF SEED BEDS.

The most satisfactory width for evergreen seed beds is four feet. This is convenient for weeding and transplanting, and permits the use of the usual lath shade screens. The beds may be of any length which will give the required ground space. Instead of having one long, solid bed, it may be broken up into 12-foot lengths by paths of a foot in width. If several beds are made parallel, they should be separated by walks two feet wide. On sloping ground the beds should run crosswise to the slope, in order to minimize washing during heavy rains.

The preparation just prior to planting need in no wise differ from that which would be given an onion or lettuce bed—a thorough spading and raking, sufficient to pulverize the soil and leave the surface smooth and moist. On dry, sandy soils it is not advisable to make raised beds, but where drainage is desired the top of the bed should be a few inches above the general level of the paths.

PLANTING THE SEED.

For small seed beds, sowing in shallow drills will usually be found preferable to broadcasting. The drills should run across the beds and be from 4 to 6 inches apart. Double drills 1 inch apart

with a 6-inch space between them are sometimes used. The drills can be marked conveniently by using a board 4 to 6 inches wide, according to the space between the rows, and using one side as a straightedge along which a stick can be dragged in making the drill. A somewhat more rapid method is to nail small three-cornered cleats to the bottom of a broad board, at the required distance apart, and mark the drills by pressing it down on the top of the bed. For example, if the drills are to be 4 inches apart, a 12-inch board should be used with three cleats, one on the edge and the two others at distances of 4 and 8 inches, respectively, from it, the edge without the cleat being placed at the drill last made in moving the board. Handles on top will facilitate its use.

Where the soil is free from weed seeds, and a high production per unit of ground space is desired, broadcast sowing may be practiced. Jack pine and Monterey pine have been found to do particularly well when sown in this manner. The seeds which are sown broadcast may be covered by scattering or sifting fine soil over the surface to a depth of about one-fourth inch, or by merely pressing the smaller seeds into the ground with the board.

The depth at which seeds should be planted depends upon the size of the seed, character of the soil, and conditions of moisture. In sandy soil and in dry climates where the beds are not sprinkled they should be planted deeper than in heavier soil or where rain is abundant. A good general rule is to cover all seed to a depth of about twice their diameter. The ordinary tendency is to plant too deep.

QUANTITY OF SEED REQUIRED.

The amount of seed to be used depends on the species and the percentage of germination. For example, 1 ounce of western yellow pine seed will suffice for 16 linear feet of drills, while an ounce of the smaller seed of Scotch pine and larch will cover about 60 linear feet of drills, or one-third to one-half pound will be sufficient for 100 square feet of seed bed when planted in 4-inch drills. With white pine three-fourths of a pound will be required for the same space, while with fir, on account of its low germination percentage, 2 to 2½ pounds should be used. As a rule the firs, larches, hemlock, white cedar, and red cedar, on

account of their lower germination percentage, and white pine, because it germinates slowly and may lie over until the second year, should be planted proportionately thicker than other species. With the above-named species the seed should be so scattered in the drills as to form a continuous row, so that on the average, if placed end to end, the seeds would all touch each other. With the other species, such as spruces, larch, and all pines except the white pine, the average number planted should be such that a seed should alternate with an open space equal to its width.

PREPARATION AND PROTECTION OF THE SEED.

In sowing most coniferous seeds no preliminary treatment is necessary, except that in certain cases it is wise to coat them with red lead, to prevent their being dug out and eaten by birds and squirrels. Red cedar seeds, however, should be soaked for four or five days in warm water, followed by two days' soaking in lye made from wood ashes. Even with this process the red cedar is a difficult tree to grow, and its use is not recommended. In all cases provision must be made to protect the nursery from birds and animals. In semiarid regions provision must be made for watering the beds, either by hand sprinkling with a watering pot or by the use of a hose. Subirrigation is seldom advisable.

PROTECTION OF THE SEEDLINGS.

A thin surface dressing of fine gravel or coarse sand applied just after the seed is sown has been found to be effective in preventing the young seedlings from "damping off." The seed bed should be kept as uniformly moist as possible, in order to insure prompt germination, and artificial shade should be provided from the time the seeds are sown.

Under normal conditions seeds should begin to break the ground in from ten days to three weeks after planting, the time depending on the species, soil and climatic conditions, and depth planted. In the case of white pine the bed should not be disturbed, even though no plants appear for a longer period than this. Weeding should begin as soon as the plants are well up, and should be continued throughout the season. When conditions of drought prevail, the

surface between the rows should be loosened frequently to assist the conservation of moisture. "Damping off" will be the greatest danger to threaten the young plants. By keeping the ground stirred and removing the shade frames to let in light and air during damp, cloudy weather, the danger can be somewhat reduced.

In regions where the winters are severe it is advisable to mulch the seed beds in order to prevent the seedlings from cold, drying winds and to prevent their being heaved out by frost in the spring. Leaves, moss, chaff, or any similar substance which is free from weed seeds, will serve as a mulch. The beds should be covered three to four inches deep. The mulch may be prevented from blowing by laying pieces of boards or sticks crosswise between the rows. It should be removed at the beginning of the growing season. In the Southwest and on the Pacific coast, or wherever the ground does not heave and the cold is not severe, mulching may be dispensed with.

One of the prime essentials in growing coniferous seedlings is to keep them under partial shade the first two years, while they are in the seed beds. When transplanted, the shade may be dispensed with. The desired shade is usually secured by a frame covered with laths (fig. 59). The simplest form is a frame 4 by 12 feet, made of 2 by 2 inch sticks, across which laths are nailed, each lath alternating with an open space, the same width. The frame is supported on posts or edgings so as to be about 18 inches above the seed beds. In a permanent nursery the frames are often hinged to posts, which enables them to be readily moved, but in the home nursery a more simple support will serve the purpose. These frames should remain over the beds except in cold, cloudy weather, when the plants show a tendency to "damp off."

TRANSPLANTING SEEDLINGS.

Except a few rapid-growing California pines, all evergreen seedlings should be kept in seed beds until two years old. At the end of this time they should be transplanted to nursery rows or set out in their permanent sites. The best young trees for planting are those which are three years old, once transplanted, but it is a most decided economy of time and cost to use two-year old untransplanted seedlings when this can be done successfully. Where

the planting site is favorable, and grass and weeds will not crowd the young trees, satisfactory results may be expected from the use of two-year-old plants. If western yellow, Coulter, or Monterey pine of this age is used, it is an excellent plan to root-prune the seedlings in the beds when they are one year old or the fall before they are set out. Root pruning with other species also is beneficial, but not absolutely essential. The roots should be pruned with a flat spade or a tool which is made especially for the purpose.

FIG. 59.—Protecting young seedlings from the sun by means of shade frames.

They should be cut off from six to eight inches below the surface of the ground.

To secure three-year-old, once-transplanted stock, the seedlings should be dug from the seed beds the spring of the second year and set out in the open four to six inches apart, in nursery rows. These rows may be six inches, one foot, or three feet apart, according to whether hand or horse cultivation is to be given them. Parallel rows one foot apart permit the use of hand cultivators. For a small number of trees closely spaced rows in a bed of any convenient size are probably best. In transplanting, the greatest care should be exercised to keep roots from becoming dry even for a moment, by carrying the seedlings, roots downward, in pails containing several inches of water.

BROADLEAF TREES.

This group includes the commonly planted broadleaf trees, such as the maples, locusts, catalpa, ashes, elms, Osage orange, mulberries, oaks, chestnuts, walnuts, and hickories. In the nursery

these trees require no shade and should be planted in their permanent places in the field when one year old. This should be done in the spring. The methods outlined below apply to the short-lived seeds of cottonwood, elms, willows, and silver and red maple, which must be planted as soon as mature, as well as to seeds which may be kept over winter.

The directions given under coniferous trees for the selection of the site and the preparation of the ground for a nursery of evergreens will in general hold for broadleaf trees as well. One essential point of difference is that to grow the same number of seedlings more ground space will be required in the broadleaf than in the evergreen nursery. Although shade frames are not necessary, it is advisable to locate the seed beds for broadleaf species to the east or north of trees or buildings, where partial protection from the sun will be secured.

PRELIMINARY TREATMENT OF SEEDS.

In order to secure prompt germination, preliminary treatment must be given certain of the broadleaf-tree seeds prior to planting. Those with thin seed coats, such as the ashes, maples, elms, Osage orange, basswood, yellow poplar, and catalpa, need no treatment. On the other hand, those with thick, strong shells, as the walnuts, hickories, oaks, and chestnuts, germinate freely only when preserved in sand out of doors during the winter, so that the shells become softened and partially decayed or are opened by frost. Another class of seeds, such as the locusts, coffee-tree, mulberries, and hackberry, require soaking in hot water in order to become softened enough to sprout quickly. The best plan is to place them in water heated nearly to the boiling point, about two quarts of seeds being used to each pail of water. The mixture should be stirred until cool and then allowed to stand four or five days, at the end of which time the seeds found floating on top should be skimmed off and planted immediately, and the process should be repeated with the remainder. It is very essential that seeds thus treated be planted without being allowed to dry out, and it is equally necessary that those stored in sand over winter be placed in the ground as soon as they are removed from the sand.

PLANTING THE SEEDS.

The seeds of the common broadleaf trees should be planted in long rows. If only two or three thousand are to be grown, the rows may be a foot apart and the cultivating may be done by hand. For greater quantities it is best to have the rows two feet apart when a hand cultivator is to be used, or about three feet apart for horse cultivation. The general arrangement and treatment should be similar to that given peas when grown for market. With ordinary success 100 linear feet may be expected to produce about 300 trees.

As with conifers, the spacing of the seeds in the row depends largely on the germination percentage. In general, fresh nuts and acorns of good quality should be planted two to three inches apart in the row, while the ashes, maples, catalpa, elm, hackberry, locusts, box elder, Osage orange, and others with an average percentage of germination above 50 should be spaced from three-fourths inch to one and a half inches apart. Those of abnormally low germinating power, as the basswood and yellow poplar, should be sown three or four seeds deep. Except in the case of short-lived seeds, which mature in late spring or early summer, all nursery planting should be done as early in the spring as the ground can be worked.

The rule as to depth of planting already given for coniferous seeds holds good also for broadleaf species. The depth should never be greater than three times the diameter of the seed. In dry seasons, or if a period of drought follows planting, moisture can be conserved and germination hastened by covering the rows with a mulch of straw or leaves. This should be carefully removed as soon as the seeds begin to break ground. Frequent cultivation should be given throughout the first season in order to kill the weeds and to keep the ground loose and moist.

TRANSPLANTING SEEDLINGS.

Most hardwood seedlings will be large enough to set out in the field the first spring after sowing. An exception must be made in the case of a few of the slower-growing trees, as the elms and birches, or when dry weather, late planting, or an unfavorable location prevents the seedlings from making a normal growth. As a

rule, if the average height is above 8 or 10 inches, the seedlings should be transplanted to the permanent site the spring they are one year old. If held in the nursery, they should be carefully root-pruned in the spring or fall of the second year. The nut trees, oaks, and catalpa form long, fleshy taproots, about one-third of which should be cut off before the trees are set out in the field.

Where the winters are mild the seedlings will be sufficiently protected if the dirt is hilled up against them to a depth not to exceed six inches, just before the ground freezes. In more severe climates they should have a covering of straw, leaves, or moss to a depth of six inches to a foot.

In general it may be said that young trees can not be grown successfully without rather careful attention. Yet it is certain that seedlings can be grown in connection with the vegetable garden at only a slight expense of time and material, and by methods very similar to well-known garden practice. The cheapness of the young trees thus produced should enable the small landowner to plant much more extensively, and to realize a good profit by the protection afforded his buildings or crops or by the utilization of waste land for the production of wood material.

Planting Cultivated Fields to Forest.

The planting of fields which have been under cultivation for a long time, to forest, encounters problems not easily overcome. Especially is this true of the poorer soils in the broken sections where patch farming is most indulged. In such localities no crop rotation is observed, and a field is continuously devoted to the raising of one crop so long as it will produce at all, and afterwards cast out as waste. In such localities and upon such lands it is expected forestry will be most followed upon a large scale. Hence field planting will here be discussed from the two views, fields which possess good humus conditions and those which do not. So far as growth is concerned upon rich and poor soils, where humus abounds, it can not be asserted that the rate of growth and the sizes which the trees attain at maturity vary to any marked extent. Wherever good humus conditions exist splendid tree growth is found. The noticeable difference is the kind of trees found growing in certain soils. The adaptation of certain trees to specific soils can not be overlooked in planting and the best results obtained.

The following tabulation will indicate the soil adaptations of trees:

- White oak, *Quercus Alba*, clay, sand upland.
- Red oak, *Quercus Rubra*, moist, rich and porous.
- Scarlet oak, *Quercus Coccinea*, low, rich, alluvial.
- Pin oak, *Quercus Palustris*, low, rich, swampy.
- Chestnut oak, *Quercus Muhlenbergii*, general.
- Swamp white oak, *Quercus Bicolor*, low, wet, swamp.
- Basket oak, *Quercus Michauxii*, low, wet, alluvial.
- Burr oak, *Quercus Macrocarpa*, low, well drained.
- Texan red oak, *Quercus Texana*, moist, rich.
- Black oak, *Quercus Velutina*, uplands.
- Spanish oak, *Quercus Digitata*, dry, gravelly.
- Barren oak, *Quercus Marylandica*, dry, sandy.
- Willow oak, *Quercus Phellos*, sandy.
- Shingle oak, *Quercus Imbricaria*, general, rich.
- Swamp oak, *Quercus Lyrata*, borders of swamps.
- Post oak, *Quercus Minor*, dry, sandy.
- Chinquapin oak, *Quercus Acuminata*, any rich soil.
- White elm, *Ulmus Americana*, general.

Hickory elm, *Ulmus Racemosa*, rich, low, wet clay.
Red elm, *Ulmus Fulva*, rich, low hillsides.
Black walnut, *Juglans Nigra*, rich, alluvial.
White walnut, *Juglans Cinera*, rich woodland.
Pecan, *Hicoria Pecan*, bottom, alluvial.
Swamp hickory, *Hicoria Minima*, wet and swamp.
Shellbark hickory, *Hicoria Ovata*, rich sand ridges.
Shellbark hickory, *Hicoria Laciniosa*, moist, rich, alluvial.
White heart hickory, *Hicoria Alba*, rich upland.
Small-fruited hickory, *Hicoria Microcarpa*, rich woodlands.
Pignut hickory, *Hicoria Glabra*, dry hills.
Buckeye, *Ascelus Glabra*, rich, low soil.
Canoe birch, *Betula Papyrifera*, alluvial sand.
Red birch, *Betula Nigra*, low and wet.
Sweet birch, *Betula Lenta*, moist, alluvial.
White ash, *Fraxinus Americana*, any rich soil.
Green ash, *Fraxinus Lanceolata*, low, rich bottom.
Blue ash, *Fraxinus Quadrangulata*, hills and ridges.
Black ash, *Fraxinus Nigra*, general.
Yellow poplar, *Liriodendron Tulipifera*, rich.
Linden, *Tilia Americana*, rich.
Sugar maple, *Acer Sachernium*, rich upland.
Black sugar maple, *Acer Nigrum*, rich lowland.
Red maple, *Acer Rubrum*, low, wet.
Black locust, *Robina Pseudacacia*, rich, low, sandy.
Honey locust, *Gleditsia Triacanthos*, low, rich.
Wild plum, *Prunus Americana*, low, rich.
Wild black cherry, *Prunus Serotina*, rich highland.
Persimmon, *Diospyros Virginiana*, abandoned.
Flowering dogwood, *Cornus Florida*, rich upland.
Hardy catalpa, *Catalpa Speciosa*, rich, general.
Sassafras, *Sassafras Officinale*, upland, clay.
Hackberry, *Celtis Occidentalis*, upper river, dry.
Red mulberry, *Morus Rubra*, rich bottom.
Sycamore, *Platanus Occidentalis*, wet, general.
Ironwood, *Ostrya Virginica*, dry, sand ridges.
Chestnut, *Castanea Sativa*, upland, rich.
Beech, *Fagus Americana*, rich upland.
Cottonwood, *Populus Deltoides*, low, wet.
White pine, *Pinus Strobis*, general hilly.
Yellow pine, *Pinus Mitus*, low swamp.
Bald cypress, *Taxodium Distichum*, swamps.
Tamarack, *Larix Americana*, swamps.
Red cedar, *Junipera Virginiana*, hilly gravel.

The planting of trees in pure or mixed relations is another matter to be considered. If the area to be forested consists of the same soil then pure planting may be consistently done, but if a variation of soils occur then a mixed planting is preferable. A

mixed planting may be done in two ways, by planting in confusion or by planting in groups. In the former the trees or seeds, as the case may be, are alternated in mixture throughout the area, while in the latter the different species are planted in pure groups or patches throughout the area, according to the different areas of soil constituting the area planted and in the relationship of adaptability of tree and soil.

There are differing opinions expressed regarding the success of pure and mixed plantings. It is held by some that pure plantings are the most successful, while others claim that mixed plantings are the best. If there be truths in the following statements: Specific plants require specific soil elements for their life and development; the soil contains many elements suited to the life and development of the multiplied species of plant life thereon; the continued growing of one form of plant life upon a soil will exhaust its substance; plants growing in confusion have a sustaining effect upon each other and upon the soil producing them; all resultant plant life is the culmination of the survival of the fittest; that all plant life is nourished by means of its leaves with which it extracts the carbon-dioxide from the atmosphere and in the sunlight transforms it into starch, upon which the tree lives and is fed, and the only substances taken from the soil by the roots of plants are water and mineral substances, which are in no way foods, then both claimants have grounds for their arguments, and the seeker for wisdom in such matters must go to nature's teachings and see how she performs them. Since nature grows them in confusion it surely is wisdom to example her. Select the best commercial species and plant them in mixture agreeable with the soil variation and there can be no question of the wisdom of the action at least.

CULTIVATION.

The cultivation of planted trees in open fields is simple. If the trees are planted in rows cultivation may be performed by plowing in the same manner as agricultural crops are tended. If they are not so planted they can be cultivated by hoeing. At the Experimental Station of Forestry both methods are employed. Both are equally successful. The amount of cultivation given them need not be extensive. Only such attention as will insure

the young trees from injury by weed and other wild forms of plant life which, if unchecked, would overcome them. The points to be well considered in all cultivation is to not peel and otherwise injure the young trees. The scraping of the bark from the young trees by the whippetree or plow, the bending over and breaking the fiber, the splitting of the limbs from the trunk or the breaking out of the top bud are things which should be avoided. Any and all of these will tend to destroy the future possibilities of the tree to attain its best commercial development. No stock should be permitted to graze or fire to burn through young trees. (See "Field Cultivation" at Forest Reservation of this Report.)

Forestry—Its Influence upon Animal and Plant Distribution.

BY PROF. STANLEY COULTER.

The distribution of plants and animals over the surface of the earth is no longer thought to be a matter of chance. Indeed, it is known to be determined by certain laws, some of which have been fairly well made out, some of which still elude us. In a general way it may be said that the physical environment determines the plant and animal life, for this environment must meet the vital necessities of the forms which it contains. It follows that any marked change in surface conditions will change in an equally marked way the life forms inhabiting a given region, for with the change in conditions there comes a change in the life possibilities of the region.

If the Kankakee marshes be drained and brought under cultivation it is very plain that great changes will take place in the plant and animal life of that large area. The ducks and geese, the lesser water birds, the myriad fish of the bayous and streams will all disappear. Some will perish utterly, others will find new homes in which their needs are met. Among the plants the cat-tails and rushes, the coarse sedges and marsh grass, the flags and water-lilies, will go, their places being taken by forms able to meet the changed conditions. This is perhaps an extreme case, but it is one which most of us will live to see, the supplanting of one series of plant and animal forms by another series sharply and definitely distinct from the first. Whether this change will, in the long run, be advantageous, time alone can prove. The illustration is merely used to show that in a very definite way the physical conditions of a region determine the plants and animals of that region.

In the desire to secure agricultural areas men have thought little of the effect of the surface changes they were working upon the life forms surrounding them. Nature through long centuries had worked out a balance of life, which man without thought has over-

thrown in a few years. In our own area these changes have in the main been of two kinds; changes resulting from drainage operations and changes resulting from clearing of forest areas. The life changes resulting from the first are perhaps the more evident, but it is doubtful if they are the more important and far reaching.

When a forest is cut away the most evident fact is the admission of the sunlight to areas hitherto shaded. The result of this change in light condition is, that a series of shade tolerant plants either die immediately or maintain a feeble existence for a few seasons and then disappear. Many of these plants have been put to no direct use by man and yet they have had their part to play in the economy of nature. Few of us can name the mosses and ferns and other forms found in forest areas, and yet we know that when they disappear the thirsty air draws the moisture from the soil more fiercely and rapidly than when their protecting cover guarded the water of the soil, which is, after all, its real wealth. Not only do these lowlier plants require shade, but many of our trees are intolerant of light and only come to their full development when they can receive the shade of other forms. Thus the possibility of the reproduction of many valuable tree forms, except as the result of careful methods is absolutely precluded. It is not necessary to give examples of changes resulting from this altered light condition, for every one reading this paragraph will recall plant after plant, formerly common, which has now utterly disappeared from the regions in which it formerly occurred.

Another result of forest clearing is a change in the capacity of the soil for taking up and holding moisture. Practically the same amount of rain falls from year to year, but as the result of the clearing of the forests more of the rain goes as "surface run off," less is taken up by the soil. Then, too, this less amount is held less tenaciously, for unprotected by the shade of the forest the earth lies exposed to the fierce rays of the sun, and unguarded by the forest floor, the soil is compelled to give up its moisture. It is not so much the amount of moisture precipitated that determines the plant life of any given area as the way in which that moisture is conserved and distributed. No profounder change in soil moisture conditions can be imagined than that resulting from the de-

struction of large forest areas. As a result of this change in condition profound changes in plant life have been brought about, and hundreds of forms have disappeared from our flora.

It is not necessary to give specific instances of change. It is evident that such marked changes in surface conditions must have worked great changes in the plant life of the State, changes still going on, and indicated not only by the disappearance of one familiar form, but equally by the appearance and spread of new forms which are taking the places thus left vacant. Almost invariably these new forms are weeds and their introduction means an increase of labor and lessening of profit.

As a rule, however, these plants which have disappeared because of changed conditions, have been replaced by economic forms, our food and forage plants, which thrive only under these new conditions, and were the changes resulting from the clearing away of our forests thus limited, it would be a change from the useless to the useful, and any loss would be more than compensated for by the rich returns.

This would be true if the story ended here, but life forms are not only intimately related to their surroundings, they are related with equal intimacy to each other. These inter-relations and inter-dependences are so close and so far-reaching that it is almost impossible to affect one form without more or less definitely affecting all. The dependence of animals upon plants is, after all, the most vital, since plants and plants alone can furnish food to animals. The existence of animals in any given region is primarily dependent upon the food supply, and any change in the quantity or quality of this food supply has a quick response in the animal life of the area. Thus when the plants of a region change the animals necessarily change, and since the relation of animal forms to man is more evident than that of plants, we may catch more clearly some idea of the importance and significance of the changes wrought by the wide destruction of forest areas and incidentally gain some idea of the possible utility of judicious reforestation. The forest is the home of many animal forms. Birds nest there, many of the smaller animals make their homes and find their food in it, and in its depths the larger forms have shelter or build their lairs. But man desires the land for tillage and in a year the for-

ests are gone and with them the life forms dependent upon their presence. The bear, the wolves and foxes for the most part, the deer, have disappeared, and even the squirrels and the raccoon are rapidly lessening in numbers. What birds have gone we can scarcely say. We know the Carolina parakeet and the Passenger pigeon have completely left us, that the ivory-billed woodpecker no longer drums in our woods, and that the number of individuals of the wood-loving forms that still remain is greatly lessened. Shelter and food gone, we can not expect their return. It is probable that we shall never feel the need of the presence of the larger mammals, but many of the smaller mammals, and especially the birds, have such close relations to agriculture and horticulture that anything which will increase their numbers will prove of great and immediate economic value.

The birds in the economy of nature hold in check two of the greatest enemies of the agriculturist, noxious insects and weeds. It has been estimated that if insect-eating birds were destroyed there would, within a single year, be a noxious insect for every square inch of territory from the Atlantic to the Pacific. Our father's father did not use sprays or other devices to guard against noxious insects. He trusted to nature's check, the birds, and the birds did their perfect work and the balance of life was maintained. Today, with the homes of birds destroyed, we are at all times practically at the mercy of the insects, or at best fight them by doubtful and cumbersome methods. Years ago the codlin moth was practically unknown, and the sound apple was the rule and not the exception. But then blue birds and orioles, creepers and so-called sapsuckers, and a host of other forms, were doing their work, and a part of it was the destruction of the codlin moth. The legislature of Pennsylvania once placed a bounty on hawks and owls, because of their destruction of poultry. In one year the State paid out nearly \$50,000 in bounties. For the next few years the crops of cereals in Pennsylvania failed and when the cause of the failure was sought it was found to be the rapid increase in the number of field mice and other grain-destroying animals, and this increase was due to the wholesale destruction of hawks and owls. The birds were nature's check for the field mice. That biological experiment cost the farmers of Pennsylvania something over four millions of dollars in crop losses.

It is, of course, impossible to restore the forests, but woodlots on farms, or the forestation of a few acres, will serve in a large measure to increase the number of these effective workers for man. If in existing woodlots plant forms furnishing bird food were introduced it would mean much. If along our roadways hedges were planted, if for no other purpose than to furnish resting places for birds, it would pay in dollars and cents. The changes in animal life resulting from a destruction of forests may be summarized as a disturbance of the balance of life by a reduction in the number of forms useful to man and a consequent increase in the number of forms injurious to man.

In the matter of protection against weeds the work of birds is scarcely less evident. For example, birds of the sparrow kind (not the English sparrow) feed almost wholly upon weed seeds. It is estimated that the weed seeds destroyed in Iowa by birds of the sparrow family amounted to 900 tons annually. Not the sparrow only, but many other forms of birds are engaged in this beneficent work, and with their disappearance or reduction in numbers the weed problem is increased.

Quite apart from the value of the wood material to be derived from woodlots or the forestation of unused areas, no farmer can afford to be without a tract of woodland if for no other reason than to give shelter and food to the animal forms which hold in check noxious insects and weeds. Until we know more accurately the life history of our various plant and animal forms we can not determine with accuracy the significance of the life changes that have resulted from the clearing away of our forests, but we do know that such serious changes in life disturbance of the balance of life works equally serious changes in life relations, and that in the main these changes are harmful rather than helpful! If by judicious forethought, if by careful methods in the utilization of waste areas, we can in some measure re-establish these relations we will have done much to lessen our labor and add to the wealth of the State.

Forest Planting in Indiana.

BENJ. W. DOUGLASS.

Few States excelled Indiana in the grandeur and extent, as well as the quality of their original forests. Practically the entire State was covered with a fine growth of deciduous trees whose wood was adapted to all of the uses of the pioneer and farmer, as well as to those of the manufacturer who followed them. From the viewpoint of the early settlers the forest was an obstacle in the path of progress, and we can easily imagine that with them our finest trees were as a curse with which they had to struggle. They needed corn more than they needed timber, and what to us seem wasteful methods were to them only measures of necessity, rendered imperative by the severity of their struggle for existence. The available supply of timber was, for many years, thought to be inexhaustable, but with the advent of the steam railroad and the rapid development of our industrial life we have seen the matchless forests not only of Indiana, but of America, dwindle away until the future timber supply has become a national problem. It was a demand for a solution of this problem that created and fostered the Forest Service of the United States Government and the forest departments of the various States. And it was the desire to assist in solving the problem that has led many scientific men into the profession of forestry, a profession founded upon the great fact that wood is an indispensable commodity, not only in our everyday life, but in the everyday lives of all who are to follow us.

To a large extent practical and experimental work in forestry has been left to the Government and until recent years only comparatively few individuals have done anything of any great moment.

However, the need of forest planting has been felt in many Indiana localities within the past half dozen years and it is the purpose of this report to present some information relative to what has been done and to draw such conclusions and make suggestions

Typical trunk form of the *Catalpa Speciosa* when grown in the open field. Never cut back nor trimmed.

as may be deemed advisable to secure the best results from the forest planting of the future.

Most of the larger tree plantations of the State have been inspected by the writer and detailed accounts of some of them will be given later.

Probably no other tree has been so widely planted as the catalpa and probably none has produced such disappointing results. Un-

Catalpa Bignonioides in open field. Typical low spreading shape.

fortunately for the growers of trees there are two species of catalpa, a good species and a worthless one—and very few of the good kind were planted by the earlier planters. Of later plantings not so many errors were made. The *Catalpa speciosa*, Warder, is a native forest tree whose original habitat did not extend far from the valley of the lower Wabash River. In that restricted territory the catalpa was a famous wood and used by the early settlers for many purposes. So eagerly was it sought that, like

Trunk of *Catalpa Bignonioides*. Notice the thin, scaly bark.

the white oak and the black walnut, it has been practically exterminated. The fast growing character of the tree and the durable quality of its wood recommended it to aboriculturists many years ago and its extensive planting has since been widely advocated.

At about the time when *Catalpa speciosa* was first being advised

Trunk of *Catalpa Speciosa*. Notice the dark rough bark.

for commercial tree planting, another form of the tree had been introduced from the South. This tree, the *Catalpa bignonioides*, Walt., was a purely ornamental species, making a low-spreading tree and boasting no value as a timber producer. Partly through cross-pollenization and partly through the ignorance of seed dealers and nurserymen, this Southern species and its hybrids have been

extensively planted. It is an unfortunate condition, for which it is very hard to fix the blame. It is impossible to tell the valuable catalpa from the worthless kind until the trees blossom and form seed pods. Again, it is not a sure method to grow trees from seed taken from a known specimen of *C. speciosa*, for no one can say that such seed is not "crossed" with pollen from a bignonioides flower. All the members of the catalpa family are prone to hybridize, that is to "cross" species, thereby creating departures from the type. In this they are analogous to the melon family. Seed taken from a fine watermelon may produce very inferior fruit, due to the fact that a pumpkin vine grew in the neighborhood of the seed plants—and yet the melon from which the seed was taken appeared prime. This uncertainty of securing pure catalpa *speciosa* stock makes the planting of this tree a very uncertain venture and one that can not, consistently, be encouraged. The distinguishing characters of the two trees may be summed up as follows:

Catalpa speciosa; tall growing, persistent main stem; bark rough; seed pods few, 18 inches or more in length and $\frac{3}{4}$ inch in diameter.

Catalpa bignonioides: low growing, much branched; thin bark; scaly; seed pods many, 12 inches or more in length and $\frac{3}{8}$ inch in diameter.

Various systems of planting have been used, in most of which the trees have been placed too close together. Close planting will produce tall straight trees, but they will be slow to take on diameter. It seems best to plant close in the rows and to put the rows farther apart. The best showing of catalpa that we have seen was planted 3 feet by 10 feet, the rows running north and south. Closer planting will produce slower growth and be harder to cultivate and much harder to harvest when it reaches a marketable size. The claim has been made that no catalpa tree will grow tall and straight unless it was planted with others, close together. This is absolutely a mistake, induced doubtless by a study of the *Catalpa bignonioides*. The *Catalpa speciosa* will make a tall straight tree even when grown in the open fields, and without any cutting back or pruning, but, as we have said before, it is impossible to tell the variety of catalpa trees until they have produced seed.

Next to the catalpa, the most widely planted tree is the black locust, *Robinia Pseudacacia* L. This tree grew native in the

southern part of Indiana and there are still some fine groves along the Ohio River. The wood is strong and hard and is very durable in the ground, and it is its value for posts and ties that has led to its extensive planting. The great objection to locust for commercial planting is that it is subject to the locust borer, *Cyrtene robinæ*, a beetle, the larva of which burrows through the wood, rendering it useless for any purpose and often resulting in the death of the tree. In the Schramm plantation in Hancock county 25 per cent. of the trees are already killed and practically all of the remainder are affected.

At a number of plantations experiments have been made looking to better methods of cultivation of the locust. The best growth of course is made when there is a good moisture supply in the soil. A condition of drought will check the growth of trees just as surely as it will retard any other form of vegetation. Any precaution that tends to retain the moisture in the soil will aid the continued growth of the tree and by mulching the ground before the early summer rains are over the growth of the tree can be prolonged far into the summer. Shallow cultivation of the soil (not over two inches deep) just after a rain will have the same effect as a mulch, as the broken surface soil creates a dead air space that prevents evaporation of the deep moisture.

The remark is sometimes made that locust trees will grow on any soil no matter how poor, because they "fertilize" the ground. It is true that the locust belongs to the same family as the clover and possesses the same power of fixing nitrogen from the air and making it available in the soil—further than this *no fertilization takes place*, because nothing is added to the soil that was not there in the first place. It is a common fallacy that soil which is fit for no other purpose will grow trees. Trees, like any other form of plant life, obey the universal laws which govern the growth of vegetation. A tree, or any other plant, may be considered as a factory in which the raw materials, water (from the soil), oxygen and carbon (in the form of carbon dioxide from the air), are manufactured into more complex substances, such as sugar, starch and cellulose. (Wood is largely cellulose.) Before this plant factory can manufacture any of these complex substances it must have its machinery in good working order, and this necessitates the presence of certain chemical elements obtainable only from the soil.

Seed pods of *Catalpa Speciosa*. It can not always be taken that there are but two pods in a cluster.

The machinery which does the work is protoplasm, the raw materials are carbon, hydrogen and oxygen, and light is the motive power. Good plant growth can not be expected under any condition in which any of these factors are wanting. Soil which is lacking in the "machine" elements, that is the elements necessary

Seed pods of *Catalpa Bignonioides*. Notice the large number of pods in the cluster.

to the proper formation of protoplasm, is certainly not adapted to growing trees or any other forms of plants. Some of the so-called "bad" soils of the hilly part of southern Indiana are unsuited for ordinary farm crops, but will answer admirably for tree plantations. This may seem contradictory, but it is not. The soil on

Seeds of different species of catalpa. Upper row—Japanese variety
Middle row—*Catalpa Speciosa* variety. Lower row—
Catalpa Bignonioides variety.

the rough slopes is shallow, but what there is of it is good; the objection to using it for annual farm crops is that under such conditions all of the good soil is soon washed away into the valleys, leaving the slopes rocky and barren. Under forest conditions the soil is held in position and will produce a normal crop of trees. Of course any knob country that has been cleared and used for farm purposes for any length of time will probably have become unfit for any agricultural purpose.

The black walnut, *Juglans nigra* L., has not had the attention from tree growers that it deserves. It is a fast growing tree and will form a tall, straight trunk. Where quick returns are desired on a plantation the trees can be cut for fence posts nearly as soon as any of the other trees grown for these purposes. The black walnut, however, requires a better soil than some other trees. This is perhaps due to the fact that more valuable soil elements are actually built into the wood than in other varieties. The ailanthus, for instance, is almost able to grow where it can get air and water—its wood is worthless. The black walnut as a post or tie timber is equal to white oak and sells with that oak on the market.

Our study of the pine as a commercial plantation tree has been limited, owing to the fact that pine plantings in the State have been largely for landscape purposes, and very little data is obtainable relative to them. The native pine in southern Indiana is the yellow pine, *Pinus echinata* Mill. Where they have been planted together the white pine, *Pinus strobus* L., has made a better growth than the native species.

Of all the trees that have been planted for commercial purposes, we know of none that can equal the chestnut, *Castanea dentata* Borkh. In rate of growth it excels any of the other trees in this list; its upright habit makes it suitable for telephone poles; it is very durable in the soil; it has few enemies; and there is no mistaking its young form for any other species. More will be said of it in connection with the Fairview plantation.

PLANTATIONS.

The Fairview plantation is deserving of considerable attention. It is a planting of several thousand trees, mostly catalpa and chestnut, and gives an excellent opportunity to compare the two trees. The trees were planted by Mr. William Mustard on a portion of his farm north of Indianapolis, in the spring of 1885. Several

thousand trees were put out on a tract of broken ground that was inclined to wash badly. The soil on the higher slopes is poor. The lower land is better and has produced better trees.

The trees were all one-year-old seedlings when planted and were about a foot high. They were planted in rows about ten feet apart and spaced about three feet apart in the rows. They had three years' cultivation as for corn, and have since had no attention given them. They were not "cut back," as has been advised for catalpa growing, but in spite of that they have made very straight trunks. We are unable to find any seed pods on any of these trees, but their upright habit of growth and lateness of seed bearing indicate a tendency to *Catalpa speciosa*. The patch recently changed hands and the present owners are cutting some of the trees for posts. The cutting is being done in a crude and wasteful way, so that the greatest value from the planting will not be realized.

The chestnut trees were planted at the same time as the catalpa and have far outstripped them in the race. In some cases the catalpa and chestnut were planted side by side in the same row and give an excellent opportunity to compare their relative rate of growth. It is reported that many of the chestnut trees died the first season, but as no good reason has been assigned for it, would suggest that the failure was due to some local soil or weather condition that was unfavorable to the young seedlings. There is no report of any of the chestnuts dying after the first year.

One cultural precaution that must be taken with both the catalpa and chestnut is the removal of the lower branches. Unless this is done the branch rots into the trunk and ultimately may cause the death of the tree.

Quite a lot of spruce was planted at the same time as the other stuff on the Fairview plantation, but it has not reached a marketable size.

This is the only plantation that is old enough to furnish a basis on which to estimate the commercial value of such work, but there is no data at hand relative to what it has cost to develop the plantation. Most of the work was simply incidental to the farm work and the chief expense has been the idleness of the land while the trees were growing. In this case the land could not have been used for any farm purpose, so that the loss of crops can hardly be

considered. The value of the land has increased to such an extent as to make the plantation a good investment from a real estate standpoint, and land has been utilized that under farm conditions would have soon been cut and gullied with each succeeding rain-storm till it would have been worthless for any purpose. From a rough estimate we can conclude that the marketable trees on the Fairview plantation will pay the first cost of the land, which was high, all expenses of planting and cultivation and still afford a fair profit on the investment.

The largest locust planting in the State is that of J. E. Leavitt, at Greyford, in Jennings County. It consists of 130 acres of poor land more or less hilly. Most of the trees were eighteen inches high when set out in the spring and fall of 1904. The trees will now average about eight feet in height, but many of them are in need of trimming. They have been cultivated since planting, and as a result make a good growth well into the summer. This late summer growth is tender and has a tendency to die back after a severe winter. This is true of all plantations that have been excessively cultivated. As a whole the plantation is in good condition, but is too young to warrant any estimate as to its value as an investment. It ought to pay well, as the cost of the land was low, only \$20 per acre. The most discouraging thing is the presence of the inevitable locust borer, though they are not as bad as in some other patches we have visited.

Mr. Q. A. Meyers, of Logansport, has planted 15,000 locust trees on seven acres of poor sandy soil on his farm at Lake Cicott, Indiana. The sprouts were twelve to eighteen inches high when they were planted in the spring of 1902. They were never cultivated after planting, and the total expense outside of the land consideration has not exceeded \$40. The trees were planted about four feet apart each way and it was expected that they would trim themselves. They have not come up to expectations in this respect, for the trees are badly in need of trimming. Some borers are present.

Arthur Buchanan has planted several acres of locust northeast of Lake Cicott. His plantation is similar to the Meyers patch, except that the ground is more broken. In both of these plantations there has been very little winter killing, owing to the fact

that the trees make their growth early in the year and by fall have seasoned so that they can withstand the cold.

Gustave Schramm has done considerable planting at his farm • southeast of Indianapolis, in Hancock County. One patch of locust was planted in 1902 and is now in bad shape from the borers. A second planting made one year later is not so badly infected and is much cleaner. Both of these plantings are shown in the cuts. Mr. Schramm has also planted some catalpa, but apparently of the wrong species. Some of the walnut trees put out about ten years ago are in nice shape and have made a good growth.

Mr. August Langenberger, whose farm joins Mr. Schramm's, has an excellent planting of locust. In fact, it is the best lot of locust trees that we have seen in the State. The eighteen-inch sprouts were planted in the spring of 1902 on a piece of cleared land lying northeast of a heavy woods. These woods have formed a windbreak to the locust and have no doubt contributed to its good growth. The trees were planted in rows ten feet apart and are three feet apart in the row. In spite of the wide rows the trees have made a fine growth and have no tendency to branch low. The soil is a rich black loam. The effect of the borers is not very noticeable; in fact, most of the trees seem free from the pests. As a result of the wide planting the trees have made a rapid growth, and some of them are four inches in diameter and have trunk enough to cut two fence posts. They were not cultivated after the first year.

There are a number of smaller locust plantings over the State, but for the most part they are too small or too young to warrant an account at this time.

As stated elsewhere, the pine tree planting in this State has been largely confined to landscape work. At the farm now owned by the Epitomist, an agricultural paper, at Spencer, Ind., there has been a rather large planting of white and yellow pine. While we have been unable to get any data relative to when this stuff was set out, the indications are that it is at least thirty years old. The ground occupied is a steep hill slope, soil thin, limestone outcrop. The white pine has made a growth superior to the yellow pine with which it was planted.

At Spencer there has been some chestnut planted on top of the hill on which the pines are growing. The presumption is that it was planted at the same time as the pine. Although the chestnut has the most exposed position and the poorest soil, it greatly exceeds the pine in size.

It is a common impression that chestnut trees grow low and spreading, like an apple tree. Perhaps they do—in the open field few trees do not—but when planted closely the chestnut makes a trunk as straight as a pine. They will make excellent telephone poles.

The natural range of the chestnut did not extend far above the southern part of Indiana, but it has grown successfully as far north as Michigan, showing that it will make a commercial tree over practically the whole of this State, and all things considered, it seems to be the most practical tree to grow for quick returns, and the near future will doubtless see its extensive planting in many localities.

Note.—The following criticisms are offered by the board to the above report:

The discussion of the distance at which catalpa trees should be planted merits criticism. The distances, ten feet by three feet apart, are too great to produce natural trimming, which should be made to occur at as early a date as the trees can be made to shade the lower limbs, and thus cause them to become dead and fall away. If the trees are planted at the distance given in the discussion they get too much sunlight, and numerous limbs grow from the trunks of the trees as shown in the cut therewith. Not enough shade is produced upon them to cause the dying of the limbs until they become large, and when they do become dead they cling to the trunk of the tree so long that they produce the effect of trunk injury shown by a cut accompanying the discussion.

It will be more satisfactory to plant the trees closely, and thus cause self-shading and the killing of the limbs when small, and which will soon fall away and no trunk injury will occur. The best distances are two by six feet apart or five feet apart each way, and when the trees begin to crowd each other they can be thinned out. The boles can then expand and the boles formed because of close planting will be long, smooth and much straighter than will

occur from the other plan. Even the cutting and casting away of half the trees planted at the beginning six years afterward will not be a loss in the crop at harvest time, because of the quantity and quality of product secured because and resulting from the early close planting.

Also the discussion given concerning the cutting back of the catalpa after planting and permitting to grow for a few years must be reconsidered. Much straighter trees and better results will accrue if the cutting back plan is followed. There is too much evidence of this to be doubted.

The trimming of black locust is also another discussion deserving of criticism. It is not a good thing to prune locust trees. They should be planted at distances of two by six feet, or at distances regular four and five feet apart. The locust, owing to its thinness of foliage, thereby admitting the sun's light, will stand closer planting than the catalpa, and it is more necessary in order to secure the shade for self-pruning. The truth of this has been made apparent by suggestions made to Mr. Q. A. Meyers by Mr. Douglass at the time of visiting his planting and instructing that his trees needed pruning. Mr. Meyers has investigated his planting and finds the numerous limbs upon the trunks of his trees all dead and so nearly ready to drop away from the trunks of the trees that with a club he could knock them off as easily as brushing icicles from the eaves of a building during a thaw. Close planting to produce early shading and self-pruning will form taller and smoother boles, and later thinning will give plenty of room for bole expansion in growth. The locust borers will also not be so plentiful.

These suggestions of criticism are made to give the Board's views concerning these questions, and also to permit of Mr. Douglass' expression on the same for the public's consideration.

No. 1.

Locust trees in the same row with No. 2. These trees had a mulch of hay placed around them early in the summer.

This kept the moisture in the ground and as a result the trees continued their growth well into the fall.

Locust from the Leavitt plantation.

No. 2.

Locust trees in the same row with No. 1. These trees have had the soil exposed to the sun and have made all of their growth early in the year.

Young locust sprout trimmed to straighten the trunk. When the tree dies back in the winter the terminal bud is killed and the new growth often starts from two sides and creates a "fork."

In the cut shown, one side of the fork had been cut away, leaving the other side to carry the growth upward.

The Hackberry—A Neglected Tree.

BY BENJ. W. DOUGLASS.

It was not until the cypress lands of the South had yielded the best of their cypress timber that lumbermen turned their attention to the heavy stands of tupelo, which grew with the cypress and which had been neglected because of a popular prejudice against it. Then, when the cypress was practically exhausted and the demand for wood became great enough, some one with an investigating spirit began to try to use the so-called worthless tupelo. At first it was found to be almost impossible to dry the wood without a great loss from curling and checking. Many experiments, however, demonstrated that the difficulty was not alone with the wood, but with the method of handling it. A little more care in handling it, and it was found to be easily dried and did not warp nor check, and soon plenty of uses were found for it in the manufacture of many articles.

When the hardwood forests of Indiana were cut over for their timber, practically all of the hackberry was left, and today in some localities we find that it constitutes the principal large tree of our remaining groves. In Indiana the hackberry, *Celtis occidentalis*, grows to be a large tree, while in the east it is often a mere shrub. With us there is no tree that makes a better trunk or that will cut more board feet of lumber to the tree than this same neglected remnant of the primitive forests. It is a fast-growing tree, and we have previously called attention to its value as a shade tree in city streets.

Such trees grown in a close plantation will make growth greater than any of the trees now planted for commercial purposes, though the returns from such a plantation will not come so soon, owing to the fact that the trees can not be used for fence posts, but must be allowed to stand long enough to make a large material for manufacturing purposes.

During the past season we have been investigating the standing of the hackberry as a timber and trying to learn just why it has

not been used. The claim is made that it is not a durable wood in the ground, and this claim seems to be well founded. Mill men have said that the wood warps badly in drying, but we are inclined to believe that this opinion is founded on the behavior of some other wood, as the man who made the statement also said that the wood of the hackberry was about the whitest wood that they had ever had any experience with. There are many woods that are whiter. In the log the sap wood, of which there is a large proportion, is a light greenish, the heart wood is much darker and considerably harder. Both the sap wood and the heart wood is coarse-grained, but hard and capable of taking a good polish.

The large quantities of hackberry still standing in the State should warrant a very thorough investigation of its qualities, for the need of a suitable wood for the cheaper grades of furniture and other important manufacturing interests calls for an immediate supply of cheap material.

As a type of the trees standing in the woods north of Indianapolis we would call attention to cut No. 1. This tree stands now in a real estate addition that is being sold off in city lots. It measures sixty feet to the first branch and will cut five twelve-foot logs, the smallest of which will measure eighteen inches. By a conservative estimate this tree will cut 1,900 board feet of prime lumber and scores of others fully as large can be found in every woods in the region.

The only insect enemy that we have been able to find on the hackberry is one that does no very great damage to the tree. It is the common hackberry gall, and its chief effect seems to be to produce dense clusters of twigs on the smaller branches.

We had intended presenting the results of some experiments on the hackberry timber, but were not able to secure suitable material in time to get results for this report. However, we have planned to work out a series of elaborate experiments on the wood to try to determine the best use of it, and will complete the work as outlined in time for the next annual report of this department.

Characteristic trunk of the Hackberry. The part shown will cut 300 board feet of first grade timber.

Hackberry tree in woods near Indianapolis. Shows the type of tree still to be found in considerable numbers.

DEPARTMENT, WASHINGTON, D. C., 1905.

Wood Used for Pulp in 1905.

INTRODUCTION.

The following tables of the quantity and value of wood used for pulp are compiled from reports made direct to the Forest Service by wood-pulp manufacturers. Acknowledgment is made to these manufacturers for their cordial and efficient co-operation. The number who neglected to report is less than 5 per cent.

The amount of wood used for pulp is small in comparison to the total lumber production, being about 4 per cent. of the annual production of lumber, and 3 per cent. of the value. Yet the wood-pulp industry is of much importance and has developed rapidly. According to the census of 1900 there was during the decade 1890-1900 an increase of more than 17 per cent. in the number of establishments and of more than 86 per cent. in the capital invested. The figures apply to pulp and paper mills combined, but it is safe to assume that the ratio of increase holds good if applied to pulp mills alone. A preliminary bulletin recently issued by the Bureau of the Census shows that from 1899 to 1904 there was no increase in the number of establishments, but that the capital invested increased 66 per cent. during that time.

WOOD USED.

AMOUNT AND VALUE.

A review of the statistics of the pulp industry as given by the reports of the Bureau of the Census for the years 1899 and 1904 shows an increase of 53.3 per cent. in the amount of woods used, the exact figures being 1,986,310 cords in 1899, and 3,043,459 cords in 1904. In the present report the amount of wood used in 1905 as compared with 1904 shows an increase of 4.6 per cent. The totals given in Table I show that 164 companies operating 237 mills used 3,192,223 cords of wood in 1905, which produced 4,168,964,000 pounds, or 2,084,482 tons of pulp. Statements by manufacturers indicate that the average amount of pulp produced from a cord of wood by the various processes is as follows: Mechanical, 2,372 pounds; soda, 1,033 pounds, and sulfite, 1,009 pounds. The estimate of the quantity of pulp is not wholly satisfactory, since some companies reported dry pulp and others reported pulp containing various amounts of water. Averaging all processes the figures given show a production of 1,300 pounds of pulp per cord of wood.

It has been found impossible to make an accurate comparison of the number of establishments using pulp wood in 1904 and 1905, because the reports of the Bureau of the Census do not differentiate between pulp mills and paper mills. The total number of mills engaged in the manufacture of pulp or paper, or both, in 1904 was 759. In 1905 the number of mills engaged in the manufacture of both pulp and paper was 117, and the number engaged in the manufacture of pulp alone was 120, making the total number of mills manufacturing pulp 237.

SPECIES AND PROCESSES.

Spruce is the wood most used for pulp, furnishing more than 70 per cent. of the total amount. Table II gives statistics of species and processes. The processes, broadly speaking, are two—mechanical and chemical. There are, however, two chemical processes, sulfite and soda, so called because they use sulfurous acid and caustic soda, respectively, in reducing the wood.

The greater portion of the spruce is reduced by the sulfite process. Cottonwood and poplar are reduced almost entirely by

TABLE II.—*Kinds and amounts of wood manufactured into pulp by various processes.*

Kind.	Process.

Imported...	2,800	-----	20,083	22,883	
	11,392	-----	310,666	322,058	10.1
Hemlock	30,843	344,579	-----	375,422	11.8
Pine	14,432	18,600	24,367	57,399	1.8
Balsam	10,801	45,943	-----	56,744	1.9
Cottonwood	-----	-----	10,507	10,507	.3
All other	4,777	44,341	47,621	96,739	3.0
	1,096,794	1,630,393	464,936	3,192,222	100.0

the soda process. Next to spruce and poplar, hemlock is most used. It has sprung into favor in a comparatively short time, and is reduced chiefly by the sulfite process. Pine is reduced by all processes. Balsam, a wood scarcely considered for pulp in 1899, is now widely used, mainly in conjunction with spruce. While it furnishes less than 2 per cent. of the total amount of wood used for pulp, it is practically as important as pine and would furnish a much larger quantity were it not for the limited supply.

The totals for all processes show that more wood was reduced by the sulfite process in 1905 than by all other processes combined. The respective proportions are: Sulfite, 51 per cent.; mechanical, 34 per cent.; soda, 15 per cent.

TABLE III.—*Comparison of total amounts of wood used for pulp in 1899 and 1905.*

Process.	1899.	1905.	Increase.	
	<i>Cords.</i>	<i>Cords.</i>	<i>Cords.</i>	<i>Per cent.</i>
Mechanical.....	786,840	1,096,804	309,964	39.4
Chemical.....	1,199,470	2,095,419	895,949	74.7
Total.....	1,986,310	3,192,223	1,205,913	60.7

Table III compares the amount of wood used for pulp in 1899, as given by the twelfth census, with the amount reported to the Forest Service for 1905. This shows that during these six years there was an increase of 60.7 per cent. in the total amount of wood used. The rate of increase was much greater with the chemical process, as there was a gain of 74.7 per cent. in the amount of wood used for chemical reduction, against an increase of 39.4 per cent. in the quantity of wood used for mechanical reduction.

IMPORTED WOOD.

The increasing demand for spruce has made a consequent demand by American manufacturers upon the Canadian spruce forests. This is strikingly shown in Table IV, which indicates that the importations have increased about 75 per cent. in the last six years, while spruce, which constitutes the bulk of the imported woods, increased 83 per cent.

TABLE IV.—*Comparison of wood imported from Canada for pulp in 1899 and 1905.*

Total	369,217	645,428	276,211	74.8

DETAILED INFORMATION.

PRODUCTION BY STATES.

As shown by Table I, New York leads all States in number of companies, cords of wood used, and pounds of pulp produced. Of the total number of companies (164) producing pulp, New York has 60, or more than one-third; of wood used, New York takes over one-third of all and more than twice as much as her nearest competitor, Maine; of pulp produced New York furnishes one-third, and three times as much as Maine. New York's annual consumption of wood is more than 1,300,000 cords; Maine's about 500,000 cords. Wisconsin, New Hampshire, Pennsylvania and Michigan follow in the order named. These six States consume the bulk of the wood and have 133 of the 164 companies. In annual capacity the Eastern mills far outrank those elsewhere, New Hampshire leading with an annual average capacity per mill of approximately 290,000 cords. Maine follows with more than 275,000 cords per mill.

Table V carries the State production further than Table I, and shows species and totals by processes.

GENERAL INFORMATION.

Miscellaneous information of general interest is given in Table VI. The table shows the average daily output of pulp for the mills of each State as reported by the manufacturers. A comparison of these figures with the total amount of pulp manufactured and the number of mills operating for the time given discloses the fact that they are uniformly too large. It is likely, therefore, that the figures submitted by the manufacturers represent more nearly the maximum daily capacity than the average daily output.

TABLE VI.—*General and detailed information of the pulpwood industry.*

Average.....		11.7	69,125													70.7	5.01	21		

The utilization of slabs for pulp appears to have become quite common, 138 establishments reporting their use. The percentage which slabs form of the total amount of wood, however, is small, since they rarely constitute over 10 per cent. of the total amount of wood used by a single mill.

Of the 164 companies reporting, 139, or approximately 85 per cent., carry on logging operations, which may also be taken to indicate that they own or control timber land. Only five companies depend wholly upon other States or Canada for their supply.

The price of wood at the point of shipment—in other words, f. o. b. cars or on the banks of a stream—was an item upon which

there was surprising diversity among the firms reporting; the figures in a State often varying from \$2 to \$10 per cord. In the compilation extreme cases were disregarded, as it was evident that the price given would in some cases no more than cover the actual cost of cutting and driving or hauling, while on the other hand the maximum prices submitted evidently included transportation to the mill. Of the States named, the two Lake States, Minnesota and Wisconsin, are credited with the cheapest raw material, \$3.83 and \$4.41 per cord, respectively, while in New York the average price is \$6.25 per cord. The average price per cord of all is \$5.55.

Estimates of the length of time which the supply of timber will last were very consistent within States, and the consensus of opinion is to be found in the averages given in Table VI.

The extent to which the manufacture of paper is combined with the manufacture of pulp is demonstrated in the last section of the table, where it will be noted that the percentage of the mills making both paper and pulp is very high, and, in several instances, all the mills in a State make both.

One of the interesting features brought out by the returns is the sawmill waste and the different kinds of wood now being made into pulp. Among these were noted pitch, jack, and southern pines, maple, birch, beech, white fir, and some of the pines of the Pacific coast. Of sawmill waste, sawdust and veneer cores were mentioned. It is probable that other woods and waste materials may be used for pulp, and the Forest Service has established a laboratory to investigate these possibilities.

Cross-Ties Purchased by the Steam Railroads of the United States in 1905.

BY H. M. HALE,
Forest Assistant.

The following report upon the cross-ties purchased by the railroads in 1905 is based upon statements from 770 steam railroad companies. Of those which failed to report, only one operates more than 1,000 miles of track, and that one less than 1,300. The average mileage of the remainder is approximately 45. The total mileage unreported is 8,671. Since the total trackage in the United States on January 1, 1905, was, according to Poor's Manual, 293,937 miles, the unreported trackage amounts to but 2.9 per cent. of the total.

In presenting this report the Forest Service desires to acknowledge the hearty co-operation of the officials of the various companies throughout the United States in furnishing the necessary data.

These statistics do not necessarily represent the number of cross-ties used in 1905, since they are compiled from the statements of ties purchased. However, there is but little doubt that the law of averages applies sufficiently well in this instance to warrant the assumption that the total represents, with a very fair degree of accuracy, the actual number of ties laid.

PRODUCTION.

The total number of ties reported is 77,981,227, switch ties being reduced to an equivalent number of cross-ties. Of the total number of ties purchased, 14,459,521, or approximately 18.5 per cent., were for use in the construction of new track, leaving 63,521,706 for renewals. It will be noted that this is less than the total announced in the preliminary statement made by the Forest Service under date of May 17, 1906. This is the result of a correction for duplication made in compiling the preliminary report.

Assuming that the unreported 2.9 per cent. of trackage required ties in the same proportion as the reported trackage, the total number of ties purchased by the steam railroads of the United States in 1905 was 81,562,150. Estimating 10,000,000 additional ties for the electric lines, the total number of ties purchased last year in the United States was, in round numbers, 91,500,000.

Table I shows the average cost and the total value of the various kinds of ties. The values given are based upon reports of representative roads in each region and are for ties delivered on the right of way.

TABLE 1.—*Value of ties purchased by steam railroads of the United States in 1905.*

^a Less than one-tenth of 1 per cent.

^b Per cent of all ties.

The table shows that oak, the greater part of which is doubtless some variety of white oak, furnishes 44.5 per cent., or almost one-half of the total number of ties. Assuming that the average tie contains thirty feet, board measure, the amount of timber represented by the white oak ties is over one billion board feet, or approximately one-fourth of the total amount of oak lumber produced in one year, according to the twelfth census. Nearly all of the oak is converted into hewed ties, only 12.6 per cent. being sawed.

Pine ranks next in importance, with 23.5 per cent., and while it can not be definitely stated just what proportion should be assigned to the various species, it is certain that more than three-fourths of the pine ties are southern yellow pine. The white and Norway pines should be credited with from 3 to 4 per cent. and the western yellow pine of the Rocky Mountain and Pacific Coast regions with from 17 to 18 per cent. These estimates are deductions from Table 3, which shows the number of pine ties which come from each region. Cedar ranks third with 8.9 per cent., followed closely by chestnut with 6.1 per cent. Both of these species are excellent tie woods and would figure more largely in the total production were it not for the limited distribution and supply of each. The percentage of the total number of hewed and sawed ties is, hewed, 77.4; sawed, 22.6.

Statistics are lacking for a comparison of the present output of ties with the number from each kind of timber in other years, but it is very probable that were they available it would be shown that the number and proportion of the pine ties have increased very materially within the last decade. Correspondingly, the proportion of oak ties would doubtless show a decrease for the same period.

The four leading kinds of timber for ties are oak, pine, cedar and chestnut, which combined furnish 83 per cent. of the total number, oak and pine alone furnishing 68 per cent. Next in rank is the red fir of the Pacific Coast and Rocky Mountain region with 4.6 per cent., followed by the cypress of the South with 4.5 per cent. The tamarack, or eastern larch of the New England and Lake States, and the eastern hemlock are the only other species credited with more than 1 per cent. of the total number. Beech,

birch and maple were reported in amounts of less than one-tenth of 1 per cent. each. The miscellaneous classification includes a number of woods, among which the most important are red gum, black locust, elm, hickory and red cedar. Thus some twenty kinds of timber enter into the production of railroad ties, but of these only seven at most are important.

SUPPLY.

Until a comparatively short time ago the railroads were usually able to secure an ample supply of ties from lands adjacent to their rights of way. This has been especially true of the vast network of lines which traverse the territory east of the Mississippi River. While this source is by no means exhausted, it has become seriously depleted, and where in former years the purchasing agent could contract for an almost unlimited number of white oak ties with the assurance that they would be promptly furnished, at the present time it is necessary to contract for small quantities and to anticipate the demand far in advance.

Wherever the whole tree is worked up into ties, sawing permits of by far the closer utilization of material. From this it might be inferred that the present practice of hewing the majority of the ties is poor policy, judged from the standpoint of economy. As a matter of fact, however, little of the material which is converted into hewed ties is saw timber, consisting, as it does, of tops left from lumbering both conifers and hardwoods, or small trees from which, even though sawed, little, if any, additional tie stock could be secured, and heart timber full of knots, shake and similar defects.

Where the tie was once the major product, it is now generally a minor product. The Pacific Coast is practically the only region in the United States where ties are produced as a major product of the forest. One of the most important sources of the ties in the East is the farmer's woodlot. During the winter in this region large numbers of ties are hewed and hauled to the railroads.

In determining the geographical distribution of the regions of supply, it was found impractical to attempt a classification by States on account of the manner in which the railroad companies furnished the information on this item. It was found possible,

however, to determine the source, with a degree of certainty, by grouping the States as follows:

<i>Region.</i>	<i>States included.</i>
Southern.....	Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, Ar- kansas, Texas, Indian Territory.
Central.....	Ohio, West Virginia, Kentucky, Tennessee, Indi- ana, Illinois, Missouri.
Lake.....	Michigan, Wisconsin, Minnesota.
North Atlantic.....	New England States, New York, Pennsylvania, New Jersey, Delaware, Maryland.
Pacific Coast....	Washington, Oregon, California.
Rocky Mountain.....	Montana, Idaho, Wyoming, Nevada, Utah, Colo- rado, Arizona, New Mexico.

Table 3 shows, for the various regions, the number of hewed and sawed ties obtained from each kind of timber, arranged in order of importance. The regions are arranged from left to right, according to the number of ties purchased.

TABLE 3.—*Source of supply of ties purchased by steam railroads of the United States in 1905.*

Kind of wood.	Regions.					
	Southern.		Central.		Lake.	
	Hewed.	Sawed.	Hewed.	Sawed.	Hewed.	Sawed.
Oak	11,406,130	570,806	14,554,592	2,966,758	240,824	101,823
Pine	10,197,766	4,182,193	10,400	18,600	641,941	2,420
Cedar		700			4,400,305	1,744,937
Chestnut	114,192	9,145	155,632	22,608		
Red fir						
Cypress	3,087,960	386,986	7,800	1,000		
Tamarack					3,026,193	6,491
Hemlock					1,556,421	44,278
Redwood

Spruce						
Birch	25,000		500			
Beech	2,500		2,000	1,500		2,000
Maple	25,000			500		
Miscellaneous	15,237	3,460	15,781	11,199	40,935	5,519
Total	24,873,785	5,153,290	14,746,705	3,022,165	9,906,619	1,907,468
Per cent of all ties pur- chased in region	82.8	17.2	83.1	16.9	83.9	16.1
Total of hewed and sawed	30,027,075		17,768,870		11,814,087	
Per cent	38.5		22.8		15.1	

The Southern States rank first, furnishing over 38 per cent., while the Central States rank next with nearly 23 per cent. of the total number of ties. These groups of States, which comprise practically all of the great hardwood forests of the country and

all of the cypress and southern pine forests, furnish nearly two-thirds of the number of ties. The Lake States rank next with 15 per cent., followed closely by the North Atlantic with about 13 per cent. Thus it will be seen that practically 90 per cent. of the ties are now obtained east of the Rocky Mountains. The Pacific Coast and Rocky Mountain regions, as yet, are not very important factors in the production of ties. This is explained by the fact that these regions at the present time probably do not supply tie material for much trackage beyond their limits, since the long haul to the eastern markets makes it impossible for their ties to compete successfully with ties produced in the East.

TABLE 3.—Source of supply of ties purchased by steam railroads of the United States in 1905—Continued.

Per cent.....		13.2		5.6		4.8	100.0

The method of production in the Pacific Coast region, as compared with other regions, is brought out in a striking manner. It will be seen that the Pacific Coast is the only region in which more sawed than hewed ties are produced, 82.3 per cent. being sawed. Practically the opposite condition is found in the Southern, Lake and Central regions. The Rocky Mountain region follows next in proportion of sawed to hewed ties. Here, however, but 35 per cent. are sawed. This condition is explained in part by the fact that timber is more plentiful and the stumpage value lower in the

West than elsewhere; consequently the market for the lower grades of lumber is poor, and as there is always a ready market for ties, much of the lower grades is sawed into ties. Other factors also have an influence, the most important of which is the sparse population, which deprives the region of the supply obtained from farmers' woodlots, an important feature in the eastern tie market. While it is not to be expected, as with the production of lumber, that the Pacific Coast will ever become the chief source of supply for railroad ties, nevertheless the proportion will doubtless steadily increase.

PRESERVATION.

As a result of the realization that the supply of tie material was not limitless, and more especially when it was found that the durable white oak could no longer be secured in sufficient quantities to meet the demands for renewals and new track, an attempt was made to devise methods for increasing the length of service of the inferior woods. Tie plates were introduced with marked success in reducing the wear when used on soft woods. It was soon found, however, that the tie plate was not sufficient, since the wood decayed so rapidly that renewals in a short time were often necessary. To meet this problem, experiments in preservative treatments of ties were taken up by several railroad companies, some of them working in co-operation with the Forest Service, and it seems safe to predict that within a comparatively short period of time more treated than untreated ties will be used. The statistics of 1905 show that 7,510,000 ties, or nearly 10 per cent. of the total number purchased, were given a preservative treatment of some character.

During 1905 at least ten railroad companies were operating their own plants for the preservation of their construction material, and several others are contemplating the installation of such plants. In addition to the roads which treat their own timber, many others have their timber treated at commercial treating plants.

Acting Secretary.

Washington, D. C., August 22, 1906.

Consumption of Tanbark in 1905.

BY H. M. HALE,
Forest Assistant.

The statement of the consumption of tanbark in 1905 here given is based upon the reports of 222 firms operating 477 tanneries. The total amount of bark reported is 1,104,045 cords, of which hemlock constitutes 799,755 cords, or 73 per cent., and oak 304,290 cords, or 27 per cent. The average price per cord reported for hemlock bark is \$6.32 and for the oak bark \$10.44, making a total value of \$8,232,457.

In presenting these statistics the Forest Service desires to acknowledge the efficient co-operation of the tanners throughout the United States in furnishing the desired information.

Table 1 shows by States, the number of tanneries reporting, and the quantities, per cent. and value of the hemlock and oak bark purchased in 1905.

It will be seen that the tanneries of Pennsylvania lead in the quantity of bark purchased, the total being 428,709 cords, of which 379,806 cords were hemlock and 48,903 cords oak. This is nearly double the quantity of bark purchased in Michigan, the State which ranks next in importance. Pennsylvania and Michigan are by far the largest users of bark, particularly hemlock, and together these two States purchased over 60 per cent. of the total quantity reported. In the purchase of oak bark Virginia holds first place with 73,871 cords.

Since tanneries are usually located in or near the regions from which they draw their supply of bark, the assumption may fairly be made that, on the whole, the figures for purchases also represent approximately the production in the States mentioned. On this assumption, the leading States in the production of hemlock bark are Pennsylvania, Michigan, Wisconsin, West Virginia, Maine and New York in the order named, aggregating 97 per cent. of the total production. Similarly, over 90 per cent. of the oak bark is produced by the following States: Virginia, California, Pennsylvania, West Virginia, Tennessee, North Carolina and Kentucky.

In addition to bark and chemicals, the tanneries use large quantities of extracts made from hemlock and oak bark and chestnut wood, together with a considerable amount of imported quebracho

and gambier. Sumach leaves and palmetto extracts are also used to some extent.

Table 2 gives the amount of domestic bark and extracts used by the tanneries in 1900, as reported by the twelfth census, compared with the figures gathered by the Forest Service for 1905.

TABLE 2.—*Consumption of domestic bark and extracts in 1900 and 1905.*

Kind.	Bark.		Extract.	
	Census, 1900.	Forest Service, 1905.	Census, 1900.	Forest Service, 1905.
	<i>Cords.</i>	<i>Cords.</i>	<i>Barrels.*</i>	<i>Barrels.*</i>
Hemlock	1,170,131	799,755	12,812	52,430
Oak	445,934	304,290	54,231	187,635
Chestnut				51,224
Palmetto				1,110
Total	1,616,065	1,104,045	67,043	292,399

* Barrel equivalent to 500 pounds.

While the census figures upon bark for 1900 are 512,020 cords greater than those of the Forest Service for 1905, the amount of extract reported to the Forest Service is 225,356 barrels in excess of the amount shown by the census. This indicates that while the figures of the Forest Service are incomplete, owing to the failure of some firms to report, there is undoubtedly a rapidly growing tendency on the part of the tanners to partially replace bark with extracts.

During the period which has elapsed since the twelfth census was taken the use of the extract of quebracho, a South American tree, has largely increased. Quebracho contains a very high percentage of tannin and gives excellent results when mixed with various quantities of domestic barks or extracts. This extract can be imported at a price which compares very favorably with the present price of domestic barks, and the drain on the supply of tanbark in the United States is thus considerably relieved. Unfortunately, statistics showing the importation of quebracho for the calendar year of 1905 are not available because the figures for this extract have not until recently been kept separate from those for other extracts. An indication of the extent to which it is imported, however, can be gained from the statistics for the month of July, 1906, which give 7,244,205 pounds, or 14,480 barrels, with a value of \$207,095. Estimating on this basis for twelve months gives an

importation of approximately 87,000,000 pounds, with a value of \$2,480,000. A comparison of these figures with those of the twelfth census for the amount of quebracho used in the manufacture of leather in 1900, which was only 20,360 barrels or bales, with a value of \$292,133, gives some idea of the great increase in the use of this extract. Other tropical products are also receiving considerable attention by progressive tanners with a view of supplementing our native supply to a still greater extent.

The imports of hemlock bark from Canada show a marked decrease, as will be seen by the following statement for the last three fiscal years taken from the report of the Bureau of Statistics of the Department of Commerce and Labor for June, 1906:

TABLE 3.—Imports of hemlock bark by fiscal years.

Year.	Cords.	Value.
1904 -----	14,111	\$63,460
1905 -----	13,511	64,181
1906 -----	7,467	35,860

Not only have substitutes for bark been found, but the processes in use have been greatly improved, so that in the best equipped tanneries at the present time from 20 to 30 per cent. more leather can be tanned with the same amount of bark than was possible a few years ago.

Since the statistics of the twelfth census on the materials used by the manufacturers of leather do not indicate the number of establishments using bark or wood extracts, it is impossible to determine whether the number of establishments has increased or decreased during the period from 1900 to 1905. The total number of establishments, according to the census, engaged in the manufacture of leather in 1900 was 1,306, but this includes the manufacturers of both sole and upper leather. No bark or wood extracts are used in tanning uppers, and so no reports from such tanners were received by the Forest Service.

Secretary of Agriculture.

Washington, D. C., August 17, 1906.

Wood Used for Veneer in 1905.

BY H. M. HALE,
Forest Assistant.

The figures given in this circular were compiled from statements of 128 manufacturers of veneer throughout the country. As was to be expected in a new statistical investigation, returns were not entirely complete, though they clearly indicate the relative importance of the various woods used.

The absence of figures in the census reports shows that, down to 1900, veneering had not assumed the importance of an industry worthy of special attention. At the present time, however, there are in the United States over 128 establishments which cut veneer, using annually more than 189,000,000 feet log measure, the equivalent of approximately 217,000,000 board feet, which yields 1,108,000,000 square feet of veneer. It is evident that the growth of the veneer industry has been strikingly rapid.

Veneers are of three general classes—sawed, sliced and rotary-cut. Sawed veneers, which have been longest used, are of highest grade. Sliced veneers rank next in order of quality. Although the returns from the manufacturers do not indicate the exact process, there is little doubt that 75 per cent. of the oak veneers are either sawed or sliced. The rotary process is very extensively employed for all woods except oak.

Table 1 shows the quantity and percentage of each kind of timber used and the number of square feet of veneer manufactured in 1905. The returns from the manufacturers gave the quantity of wood used in log scale; these figures are tabulated under the caption of "log scale." Since the mill scale will, on an average, overrun the log scale about 20 per cent., in computing the average number of square feet of veneer produced per foot board measure the log scale was converted into mill scale by increasing each item 20 per cent., in the belief that results so obtained would be more accurate than those based on log scale.

It should be noted that the results do not represent the average thickness of the veneers, as might at first be supposed, because the item of board feet carries the gross amount of wood in the log,

while the item of square feet of veneer includes the finished, salable product only, no account being taken of the waste from reducing the log to a true cylinder or from saw kerf, slabs, or defective parts of logs and cores. For example, when veneers are sawed one-twentieth of an inch thick, another one-twentieth of an inch is lost in saw kerf, so that, even provided all the other forms of waste are saved, not more than ten thicknesses can be obtained from a board an inch thick.

TABLE 1.—*Wood used and veneer stock produced in 1905.*

Total.....	100.0	181,146	1,108,518	5.1

The importance of red gum, which furnishes in this industry 21.8 per cent. of the raw material and nearly 17 per cent. of the veneer, is clearly indicated. This is the more striking when it is remembered that this species has been utilized only a few years.

Maple ranks second in quantity of raw material, and furnishes 14.5 per cent. Yellow poplar is the only other kind of timber furnishing more than 10 per cent. of the raw material. It ranks third both in quantity of wood and square feet of veneer. These three species, red gum, maple and yellow poplar, furnish more than one-half of the total quantity of wood used.

White oak, although ranking fifth in the scale of quantity, holds a high place among the veneer woods. Probably no other veneer is so much in demand as this, and if data were available to show its exact value the result would be a revelation to those not thoroughly familiar with the situation.

The results show that for all species the average number of veneers produced per foot board measure is 5.1. Of the individual species, beech is cut the thinnest, the average being 11.1 square

feet per board foot. This is doubtless due in part to the fact that this is a favorite wood for the manufacture of wooden plates, and such stock is cut about thirty to the inch. Walnut ranks next, with 10.2 to the inch. The fact that it is a scarce and valuable wood readily accounts for this. Sycamore, cottonwood and pine are cut thickest.

The use of a large number of species for veneering is shown by the reports. While the fifteen kinds tabulated constitute by far the greater part of the wood used, there are nearly as many more used in small quantities, among which are cherry, chestnut, butternut, hickory, cucumber and holly. It will be noted that in Wisconsin the leading wood is basswood; in Tennessee, red gum; in Indiana, white oak; in New York, maple, and in Missouri, cottonwood.

Not all of the wood classed as veneer is actually used for veneering in the true sense, for with the development of veneering machinery a number of new uses have been found for wood in the form of veneer. Such of the softer woods as gum, cottonwood and poplar, are largely veneered for boxes, baskets, egg crates, and similar products. Such woods do not yield high-grade veneers, but are used extensively for building up panels to be finished with a choice wood.

Woods which take a good finish and possess a pleasing grain or color, such as oak, maple, birch or walnut, furnish the bulk of the true veneers; in fact it may safely be assumed that practically all of the walnut and oak and a large percentage of the maple shown in this report are used in this way. Furniture, and to a limited extent, interior finishing, consume the most of these species.

One of the most difficult problems to solve in the handling of veneer stock is the drying. A query in regard to drying methods was sent to manufacturers, but the replies failed to indicate a marked preference for any one method. One-third of the establishments use no artificial process. It does not follow, however, that as much as one-third of the veneer is dried in the open air. On the contrary, probably much less than one-third is so dried.

The economical use of the cores which remain after a log is cut by the rotary process is a problem of such general interest that inquiry was made on the schedules as to the present practice. The results show that 39 establishments use all cores for fuel; 50 use all

or part of them for fuel; 33 convert them into excelsior. One reports use for pulp; another their use for porch posts. The remainder report various uses, chiefly, however, combinations of lumber, excelsior, crates, boxes and baskets.

Wood Used for Distillation in 1905.

BY H. M. HALE,
Forest Assistant.

The following statistics of the wood used for and the products of distillation in 1905 have been compiled from reports made by the operators of eighty-two distillation plants throughout the United States. The returns give the amounts of softwoods and hardwoods, but not the separate amounts of each kind in each class. Of the hardwoods, it is safe to say that beech, birch and maple furnished over 80 per cent. of the amount, while oak and other kinds of timber furnished the remainder. Of the softwoods, all of which are native to the South, long-leaf pine probably furnished by far the greatest amount.

The tables show that the total consumption of the eighty-two plants was 676,739 cords, valued at \$2,010,611; and that the products comprise 26,670,139 bushels of charcoal, 5,062,076 gallons of alcohol, 86,685,129 pounds of acetate of lime, 238,180 gallons of turpentine, and 1,039,980 gallons of tar and oil, besides 434,780 gallons of oil from pine distillation. The total for tar distillation from hardwoods is very small. As a matter of fact, the figures do not even approximate the actual amount, but, instead, represent only the amount saved and refined. Owing to certain characteristics of the tar obtained from hardwoods, which make it of low commercial value, most of it is used for fuel, either in carbonizing the wood or in refining the liquor, and when so used no record is kept of the quantity produced.

HARDWOOD DISTILLATION.

Tables 1 and 2 give the quantity of hardwood distilled and of the products. It will be seen that three States—Michigan, Pennsylvania and New York—are in the lead. Of the States included under the heading "All others," Missouri ranks first. It may therefore be asserted that the hardwood distillation industry is practically confined to these four States. The sixty-seven plants

reported from these States 659,770 cords of hardwood, with a total value of \$1,967,806. The products were 26,370,033 bushels of charcoal, 5,062,076 gallons of alcohol, and 86,685,129 pounds of acetate. For the reason already given the amount of tar, oil, etc., is not correctly represented by the figures given.

TABLE 1.—*Hardwood distillation.*

State.	Number of establishments.	Wood used.		
		Cords.	Average value per cord.	Total value of raw material.
Michigan	6	239,992	\$2.61	\$627,521
New York	22	119,937	3.20	383,691
Pennsylvania	35	242,519	3.51	851,579
All others ^a	4	57,322	1.84	105,015
Total	67	659,770		1,967,806

Kentucky, Maine, and Minnesota.

TABLE 2.—*Hardwood distillation.*

State.	Products.			
	Charcoal.	Crude alcohol.	Acetate.	Tar and oil.
	<i>Bushels.^a</i>	<i>Gallons.</i>	<i>Pounds.</i>	<i>Gallons.</i>
Michigan	8,143,387	1,246,121	14,778,695	549,730
New York	4,986,865	1,392,995	25,392,564	20,000
Pennsylvania	10,478,794	2,324,329	45,778,093	80,750
All others ^b	2,760,987	98,631	735,777	27,000
Total	26,370,033	5,062,076	86,685,129	677,480

^a Bushel equivalent to 20 pounds

^b Kentucky, Maine, and Minnesota.

Pennsylvania leads in the amount of charcoal per cord, the results showing an average of 860 pounds, or 43 bushels. New York ranks second, with 840 pounds, or 42 bushels. Michigan, with but 680 pounds, or 34 bushels, is in striking contrast to the average production. In number of gallons of alcohol produced per cord, New York leads both Pennsylvania and Michigan, with an average of 11.6 gallons, followed closely by Pennsylvania, with an average of 9.6 gallons. The average for Michigan is but little more than half of either of these States, namely, 4.8 gallons. This may be due to the fact that in New York and Pennsylvania the wood is carbonized almost entirely in retorts, while in Michigan the brick kiln with direct fire is generally employed.

PINE DISTILLATION.

Tables 3 and 4 show the quantity of pine distilled and the products. Compared with the figures for hardwood, the quantity is insignificant; the total amount used by the fifteen operators reporting was but 16,969 cords, with a value of \$42,805. The products differed, of course, from those of hardwood distillation, in containing a large amount of tar and turpentine, but no alcohol. Much less charcoal is obtained from pine than from hardwood, the average relative proportions being approximately 350 pounds per cord, as against approximately 700 pounds per cord. Tar, a by-product in hardwood distillation, is one of the major products of pine distillation. The average price of pine wood per cord is also lower.

Miscellaneous Papers Upon Topics of Forestry

FOREST LAND TAXATION.

The ideas contained in the following discussions of taxation were attempted in a bill for enactment into a law before the Indiana General Assembly of 1905, but was ascertained to be unconstitutional, and consequently was abandoned. The ideas contained in the bill attempted to be enacted were original with the Board of Forestry at the time, and it is believed if such a law could be made and honestly obeyed it would be of value to forestry and the State.

How Shall Forest Lands be Taxed?*(In Two Parts)

PART II.—A Proposition to Encourage the Growing of Forests for Profit.

BY ALFRED GASKILL.
Forest Inspector, U. S. Forest Service.

HOW FORESTS SHOULD BE TAXED.

On approaching this subject one naturally turns to those European countries in which forestry has become an art, for, manifestly, no oppressive burden of taxes could be borne where the growing of trees is found to be so profitable. The conclusions from such a study are two: (1) That the systems of taxation are so radically different from ours that only general principles can be applied here; and (2) that the assessments are always based on the actual value of the forest, or on the earning power of the land, that is, its yield.

The first principle in all these laws is that the forest shall be considered and rated apart from the land upon which it stands. This principle finds universal acceptance in theory at least, though the practice differs in the various countries, and is based upon the fact that a forest is a crop of many years' growth and represents the owner's savings—the accumulated capital and interest on a time investment. This fact is as obvious here as it is there, and in my opinion makes it necessary for us to admit that in any piece of forest property the soil alone is realty, the growing trees are re-invested income—that is personalty.†

To illustrate: A man has two fields. On one he raises corn, and year by year puts the value of the crop in bank or buys securities, which he holds and on which he pays, or should pay, a personal property tax. On the second field he plants trees; they thrive and make a good growth, but at the end of the season they are not convertible into money as the corn crop was. So it is for

*Paper read before Society of American Foresters and Fourteenth Annual Meeting of the National Wholesale Lumber Dealers' Association.

†The forests of the German States, for instance, are estimated to have 75 per cent. to 85 per cent. of their value in the timber and 25 per cent. to 15 per cent. in the land.—M. Endres, "Forsten," in Conrad's Handwörterbuch der Staatswissenschaften, 1900.

many years. The tree crop is made each season, but must be left on the stump until enough wood is accumulated to make it salable. Suppose the farmer, instead of selling his corn, had put it into a crib and added the second and third and each succeeding year's crop to the first; would he not accumulate personalty in the crib of corn? He does the same with the product of his trees, but the result shows this difference: The crib of corn earns no increase; it represents only simple interest on the land; it is not like the money in bank that might have been obtained by selling the corn, which would earn compound interest by being reinvested with the accrued interest every year. In the growing forest, however, the increase in value is reinvested; the owner expects his trees to yield him a profit on the capital which they themselves represent, as well as on the capital which the land represents. But the two values—that of the trees and that of the land—are distinct.

It is thus evident that because the tree grower must reinvest his annual crop in stumpage it is no reason for considering it real estate. In the view that forests can be reproduced, trees are virtually movables, and the practice of rating them a part of the land is the fundamental error in every American State.

Theoretically it is as proper to tax growing grain as growing trees; but since the grain matures in one year, while the trees require many, and all our fiscal arrangements are based on annual returns, the trees should be taxed though the grain be exempt. Here, however, comes in the second principle in the taxation of forests, that it is unjust to require the owner to pay so long as the forest yields him nothing. There is no equity in making a man's other property carry his immature forest. In practice this works out in various ways. Most of the German States have not yet made the principle effective, but Baden exempts newly-established forests from tax for twenty years (law of 1886). In Austria they are exempt for twenty-five years (law of 1869). In France three-fourths of the land tax is remitted for thirty years.† In connection with these laws it should be remembered that forests in Europe begin to yield salable material when they are from twenty to thirty years old. In most parts of the United States the pro-

†M. Endres, Die Besteuerung des Waldes, in Forstwissenschaftliches Centralblatt p. 509, 1899.

ductive period begins later because there is no market for small wood.

This principle of exemption or rebate is familiar enough in this country, where undeveloped property of all kinds is taxed at a nominal rate. Farm land not cleared bears little. A comparison can not be made, however, with other forms of unproductive property—city lots, for instance. The owner of the latter produces nothing from his land; he hopes to gain by what others do. The forest owner, on the other hand, does produce something of value and will eventually pay a proper tax on it.

One reason why forest property is held in such high esteem in most of the countries of Europe is that the taxes are levied fairly. No matter how high the rate in any locality may be, the owner has the assurance of absolute equity in the valuation.

It would be impossible to apply the European system here with anything like the exactness that attaches to it in the old countries, because we have not the means of knowing the true worth of forest soil or of forest crops, but the principle is applicable anywhere. Even in the hands of non-expert assessors it gives a fairer basis of valuation than our present method, and in the long run will insure larger returns.

This is the equity of forest taxation; but the communities have another interest than that of revenue, namely, to maintain the forests in the greatest possible extent and effectiveness for the sake of lumbering and its many dependent industries, and for the influence that they have upon stream flow and the modification of climatic extremes. These subjects are beginning to be well understood, and need not be dwelt upon.

POINTS TO BE CONSIDERED.

The points that, in the writer's opinion, should be considered in any equitable scheme of forest taxation are the following:

(1) Forests are necessary to the public welfare, and consequently each commonwealth should bear a part of the cost of maintaining them. This means that the State treasuries should assume a considerable part of the obligation, and, as far as is proper, relieve the counties, because a region that is rich in forest is poor in everything else—population, farms, industries—and it is right

that the cities and towns should contribute to the maintenance of conditions that are as important to them as they are to the people who live close to the forest borders. Exemptions and rebates, as usually allowed, do not meet this requirement, because the county bears the burden; that is, if one piece of property pays less, all the rest must pay a higher rate to make up the deficiency. In no case are exemptions justified, unless everyone who shares the burden of it is correspondingly benefited. If a piece of private forest serves to protect a drainage area, or is valued for its beauty, it is right for all who enjoy or profit by it to pay a proper share of the local taxes. For instance, if a town or village wants the owner of a woodlot to keep it for the people's pleasure they may remit the taxes on it, because no one else is concerned.

But a State can not properly declare that its forest reserve shall be untaxed, because such action robs the counties of the revenue that they need. New York, which holds the largest State reserve, recognizes this principle and pays local taxes on its land. The Austrian state forests pay taxes on land and income. With our national holdings the same principle should apply in all cases where land previously subject to taxation is taken over.*

(2) A forest is a form of property whose value is potential or prospective most of the time; only when the trees are market ripe can an income be derived from it.

(3) In consequence of yielding periodic returns, the greater part of the tax to be paid upon a forest should fall due when the timber is sold, and not to be made a burden upon the other property of the owner through many years. The periods at which forests may yield returns should not be considered as the full time required to grow the average tree; some trees mature more quickly than others, and all natural forests contain trees of various sizes and ages. It is doubtful if any forest containing the usual diversity in size or species, and now market ripe, would not yield again within twenty years if cut carefully. This point is often overlooked, yet it is of great importance in considering the periods during which a given piece of forest would pay only on the ground tax.

(4) The deferred tax should bear a fair relation to the net yield

*Under a new law enacted in 1905, Pennsylvania pays to the counties, in lieu of taxes, 5 cents a year for each acre of State land.

of the property; that is, it should not exceed a sum that will leave the owner the equivalent of a fair annual return on his investment.

(5) Forests occupying land of the kind here considered grow too slowly in most situations to yield by their annual increment a rate of interest comparable with that commonly expected from ordinary business enterprises; they may easily produce wood at a rate that will compare favorably with the interest derived from State or national obligations.

(6) Forests are exposed to unusual risks from fire and depredation, owing to their very general use by the public.

OBJECTIONS.

What are the objections that may be urged to a law embodying those principles? The fundamental proposition—that forests be assessed apart from the land upon which they stand—suggests a radical change in the tax system of most States; but forestry itself is radical and demands new methods. Apart from that the only difficulty is to fix the values of land and forest. If it be admitted that forest owners are entitled to special rates on such property on account of its public value, the constitution of no State is likely to prove a bar to the necessary legislation, since existing bounty and exemption acts evidence the power of the legislatures. But if such difficulty be encountered it probably can be overcome by putting forests into a special class for purposes of taxation. The real questions, then, are how to fix the value of a forest and how to provide for the collection of the tax at intervals. The problem is less difficult than it appears to be. If the land alone is made to pay a yearly tax on its actual value, determined by the assessors in the usual way, the county gets at least as much income as it would if the forest were not there.

Then let the whole question of timber value be determined by what it sells for, and base the forest tax on that. Everything that comes out of the forest must pay the accepted rate of tax. Of course, safeguards must be provided; intermediate yields as well as the main crop must pay their shares, a proper return of quantities and value of material sold or used must be insured, and provision made for an adjustment of loss in the event of seri-

ous damage to the property by fire or storm. If theft is committed, it may be assumed that the county is equally responsible with the owner. The county being thus protected against loss, the owner, on the other hand, must be assured that the rate will not be raised when it is known that his timber is ready for market. The deferred returns from this source would be viewed as sinking-fund accumulations, or they might be used as a basis for bond issues to supply special needs.

A law framed along these lines would, of course, have to be adapted to local conditions and practices. Its proper execution would involve some increase in the executive personnel, yet even without that the change could not fail to be an improvement on the present system.

HOW THE PLAN WOULD WORK.

It is difficult to illustrate this plan as applied to a forest already grown, but which may not be cut for several years, without accurate knowledge of the value of the stand and of local conditions. Perhaps it would be found safe and entirely reasonable, in most cases, to remit the taxes until the trees were cut, and then collect a definite proportion of the net yield for each year that tax has been unpaid. The difficulty naturally is to determine what that proportion should be, and it can only be settled by applying the principle to concrete cases.

But it is possible to find an illustration in an example of a forest grown on ground that is now bare. Let it be assumed that 50,000 acres of pine land in Michigan, valued at \$1 per acre, will yield, eighty years hence, 350,000,000 board feet of lumber, worth \$7 per thousand on the stump. The figures are conservative, and if a young forest be already started on a portion of the area, so much the better. If the local tax levy is 2 cents, on a two-thirds valuation, the land will pay to the county $1\frac{1}{3}$ cents per acre, or \$666.67 per year. Then, if the State pay half a cent per acre on account of the public utility of the forest (see table) the county will receive \$250 more, or a total of \$916.67 yearly. In practice, the forest would begin to yield something after thirty or forty years, but for the sake of simplifying the calculation let it be assumed that it is all cut at the end of eighty years. How

much of the sale price should the county get? The forest at one year old is actually worth nothing, hence no tax can properly be charged against it. At two years old it is nearer maturity, but still has only an "expectation value," based upon what the mature trees may yield. In short, the value increases year by year from nothing to \$2,450,000, when it is 80 years old.

The values upon which a tax might be levied each year are thus difficult to determine, but an average may be assumed to be the expectation value of the forest when it is 40 years old. That is \$2,450,000 discounted at 4 per cent. for forty years, or \$510,310. Then if exemption were allowed for the first thirty years the collectible tax would be the accepted rate paid on that sum yearly for fifty years. It is manifest that the accepted rate can not be the same as that applied to the land—2 per cent. on a two-thirds valuation—for when continued for fifty years the sum of the taxes amount to nearly half the final value of the crop. Such a proportion is prohibitive, and it must be admitted that forests can not pay the high rates commonly levied on real estate—at least, not until the crop is worth relatively more than it is now. This fact is strongly emphasized if we ignore all rebates and allowances and say that the forest shall pay $1\frac{1}{3}$ per cent. of its value yearly. Eighty times $1\frac{1}{3}$ per cent. equals $106\frac{2}{3}$ per cent.; in other words, the whole crop would not pay the tax.

For the purpose of the present illustration, it may be assumed that the rate is one-half of 1 per cent., and, again, that money is worth 4 per cent. The total return at the time the timber is cut will then be \$389,537, or about 10 per cent. of the stumpage price. It is possible that in some cases the county might claim more. The figures in any event would depend largely upon the length of time involved; but bearing in mind the importance of encouraging the owner to keep his forest standing, the proportion may be accepted as about what should be paid. The county is distinctly better off than it would be under the present system, for, instead of uncertain returns or no revenue at all, if the land were relinquished, it has the assurance of a reasonable yearly revenue from the land, and a lien upon the mature forest for a further sum which, discounted at 4 per cent., is equal to \$706.65 a year.

This example does not pretend to be exact in any respect; it is purely illustrative; yet if the land value, the yield, and the in-

terest rate be accepted as reasonable, the following table will show that both owner and community are treated fairly. If the owner's profit appear too small for the risk involved it should be remembered that no allowance is made for a very probable advance in land and stumpage values.

Comparison of Tax collected and owner's profit from a forest of 50,000 acres yielding timber worth \$2,450,000 after eighty years.

County's Interest.

Yearly revenue from land.....	\$666 67
Yearly revenue from State.....	250 00
Yearly revenue from forest, calculated from final return.....	706 65

Total	\$1,623 32
Or practically $3\frac{1}{4}$ cents per acre = $3\frac{1}{4}$ per cent. on a value of \$1.	

Owner's Interest.

Investment—

Land at \$1 per acre.....	\$50,000
Capital to produce \$666.67 yearly for land tax and \$1,000 yearly for management.....	41,667
Total	\$91,667

Receipts—

For stumpage	\$2,450,000
Value of land.....	50,000
Capital set aside to pay taxes and management.....	41,667
Gross total	\$2,541,667
Less deferred tax.....	389,537

Net total	\$2,152,130
Profit = 4 per cent. (about) compound interest on the investment.	

CONCLUSION.

In conclusion, forest taxation is peculiarly a legal question which each State must consider individually and without interference from the national government. Any enactment must harmonize with the fundamental law and do justice to all interests. Opposition to any measure is sure to be encountered, and for that reason a radical proposition has some advantage over one which, like an exemption act, would seem to favor a class. Emphasis needs to be laid upon the point that whereas the ability of most

of the States of the Union to acquire forest reserves is limited by lack of revenue, those which contain the largest areas of private woodlands have the power above all others to keep the forest in those places that are naturally adapted to it.

From these considerations it appears that the actual situation can be met only by accepting a principle in taxation which shall definitely recognize the public value of growing forests and in its application strive to maintain them as the sources of material needed in important industries and as valuable climate factors. This means that private property in forests should be taxed with reference to three considerations: (*a*) Necessity—the support of the local government; (*b*) equity—an assessment based upon the actual yield, collection of the tax (on the trees, not on the land) deferred until the crop is sold, and a recognition of the peculiar risks—fire, trespass, etc.—to which forests are subject; (*c*) encouragement—a special rating of the property to compensate the owner for whatever expense attaches to maintaining the forest in a condition that best serves the public interest.

How Should Our Future Forest Lands be Taxed?*

BY S. B. ELLIOTT.

Member Pennsylvania State Forestry Reservation Commission.

The following is a tardy compliance with a promise made several months ago to discuss in the columns of *Forest Leaves* the very important and pressing subject of taxation affecting the reforestation of the waste, barren and cut-over lands in our State. All observing persons, all land owners, and all those who have to do with the lumber interests of our country, know that as conditions now are no reforestation of those lands, whether naturally or artificially attempted, can take place while fires are allowed to devastate them or assessors allowed, as heretofore and now, to fix such values upon them and the young timber growing thereon, as may make it so unprofitable to the owners as to cause them to refrain from attempting it.

It is well known that in the past many owners of valuable timber tracts have been forced, from heavy taxation, to cut and throw their product upon a glutted market to save that product from practical confiscation; and this sort of work has done much towards bringing about the present deplorable state of depleted forests.

Forest fires can and must be controlled, and it is gratifying to know that public sentiment is awakening to the necessity of it that fires, especially upon State reservations, are less frequent. While it may seem hopeless now, awakened public opinion brought to bear upon the careless, heedless, offender, and the law upon the wilful one, will and must settle the matter without disagreement; but it is not so with the question of taxation. Regarding that men may disagree as their varied interests may be involved, but all should admit that taxation should be so adjusted that it shall be equal, just, and fair as possible, and the general welfare subserved.

*Reprinted through the courtesy *Forest Leaves*.

There is no tax for State purposes levied upon land in Pennsylvania, and whatever may be levied upon realty must, therefore, be local. The rate of such local taxation varies with the needs of the community, and only the so-called rural districts can, in the very nature of the case, place a tax upon land with young and growing timber on it. Therefore, any tax that shall fall upon land, consequent upon growing young trees thereon, must, necessarily, fall heavier upon rural districts than on towns and cities. That inequality should be relieved as much as possible, for the towns and cities require timber as much as the rural districts.

Article IX, Section 1, of our State Constitution, provides that "all taxes shall be uniform upon the same class of subjects." It is held that, under this clause, land can not be exempted from taxation, save where it shall be used for public purposes. This view is certainly logical and must be correct, and in the scheme I shall propose for relieving young growing timber from taxation, until such time as it shall reach an age wherein it shall have a commercial value when cut, will in no way conflict with that conclusion.

There can be no truthful denial that the assessor of the past (and he of the present time is of the same mind), persistently laid a heavy valuation upon all land having growing or standing timber upon it, and what he has been doing in the past he will be almost certain to do in the future, unless positively forbidden.

Our Legislature has endeavored to circumvent him to a certain extent by providing for a rebate of taxes, not to exceed forty-five cents per acre, on land which may have three hundred or more growing young trees upon it, but he promptly puts that rebate out of action by increasing the valuation on that or the remainder of the owner's holdings, and in this it may be reasonably expected that the county commissioners will uphold him. It must in some way be so fixed that it will be impossible to impose a tax on growing trees, or the owner thereof, until such trees have a value as a merchantable commodity if cut. Without that restraint no one need expect that land owners will plant or care for trees when they must wait half a century for returns on their investment and, in addition, endure increasing taxation besides.

But can this be done? Can we separate the products of the land itself for the purposes of taxation? It is an established principle

in taxation that land taxes may be measured by area, or they may be measured by rents—which, in a sense, is a product—or by value; and no matter which system prevails we primarily fix the value, in most cases, by what the land may produce. But suppose the rental or product of the land shall not be available in any possible way for half a century or more; can any one give a good reason why such rental or product should be subject to an annual and increasing tax?

That a tax should be levied and paid when the rental or product is received or becomes of merchantable value is not questioned nor proposed; but what is suggested is, that such an extension of time should be given as will permit the holder of the land to be in a position to realize on his, thus far, non-paying investment, and then tax for full worth as on other property. In other words, tax the land annually as land, according to the Constitution, but at no higher rate than if no trees were growing upon it, and when such trees arrive at a marketable age, and salable, if cut for any other purpose, then tax the trees, which are simply the product, as well as the land.

Do we separate the land from its products in the matter of taxation in our State? Most assuredly. The act of the Legislature referred to (see act approved April 20, 1905), practically does that by partially relieving the land of taxation. Timber growing on land may be assessed to one party while the land is assessed to another. The case is the same with coal—both products of the land. Whether timber of suitable age, or coal lying in the ground, should be taxed before removal for sale is a question not, at this stage of the argument, under consideration, but the United States Government, by act of Congress, permits dutiable goods to be stored in bonded warehouses without payment of duty until removed for sale, and the law is the same in certain cases where an excise duty—internal revenue—is not collected until the goods are taken from the bonded warehouses. But in regard to the timber trees referred to, the difference claimed between them and young growing ones is, that one is ripe, and now merchantable, if cut, while the other is not, nor can be for a long time, and the contention is that taxes should be levied until the growing trees shall have, at the time taxation begins, a then present value.

In this State we do not tax colts or young cattle until they are

four years old—an age in which they are esteemed to have a merchantable value. A farmer may thus make a business of growing young cattle and young horses and disposing of them without being subject to taxation at all. Thus is the product of the land separated from the land itself in taxation.

The value of young trees is purely prospective. It may never materialize. Fire, disease, or insects may destroy it. It has no marketable value until large enough for use, and it can not be conceived that our Constitution contemplates taxing non-existent or prospective values. It is real ones, actual ones, present ones that should be the subjects of taxation.

It is pertinent to remark that there is more or less land in every county in our State that is unsuited for the general purposes of agriculture—land from which all merchantable timber has been removed or killed by fire. All such is subject to taxation under our Constitution, and, as the law upon stands, any trees that may now exist there, or may come to grow upon it in time, may be considered by the assessor as having a value, when, in fact, the only value that can be conceived is a prospective one. The assessor may assume such value as he sees fit and add it, increasing it each year, to that of the land for the purposes of taxation. That in our present system, right in the face of the fact that no revenue can be received for many years, and the further fact that this prospective value may be wiped out at any time by fire or disease. At the very best, land devoted to tree-growing can not escape bearing a heavy burden. It should be placed in a separate class from that devoted to the general purposes of agriculture. A little computation will show how unequally it stands when compared with others.

It is certainly fair to assume that three dollars per acre is the net annual income from cultivated land after taxes and all legitimate charges in cultivating have been considered. In forty years—the time required for nearly all our valuable timber trees to grow to be at all suitable for merchantable timber, and most of them require sixty or more years—the sum received will amount to \$120. As the owner gets the money each year he has the use of it, and it is but right that interest should be added. Simple interest of five per cent. would increase the sum to \$240, while

compound interest—and that is what should be reckoned—would make it amount to \$376.14.

Now, take an acre upon which trees shall be planted. No income at all equal to cost of planting and care, up to forty years, can be received, except in the case of one or two species of quick-growing trees used for special purposes, and, should no additional tax consequent upon the growth of the trees be put upon it, and a tax of only three cents per acre be levied upon it to meet the requirements of the Constitution, the owner will, in forty years, have paid out \$1.20 in taxes, and putting compound interest on this the amount will be \$3.76. One case shows a gain of \$376.14, and the other a loss of \$3.76, to say nothing of the use of the money invested in planting trees and caring for them. One shows an annual net return of five per cent. on land valued at \$60 per acre that in all probability was not assessed at one-half of that amount, and the other a loss of three cents per acre on whatever sum you choose to value the land at. One must look in vain for uniformity here.

But what can be said in defense of adding to the burden of the timber land by assessing an assumed, prospective value upon it? If such shall be persisted in it will amount to absolute prohibition of reforestation in this State. Under the very best system that can be devised the owners of land will not be eager to engage in an enterprise that will take so long a time to materialize.

But can a better system than that now in vogue be devised? That is the problem before us, and it is a very serious one. Taxation is a profound and perplexing question, and, at best, must be a matter of compromise. However, the task of reforming our system will never be accomplished unless some plan shall be proposed, and, claiming that a better plan is possible, the following is put forth for consideration:

Let a board of competent freeholders of the county be appointed by the court, or elected for that purpose, whose duty it shall be to fix a valuation on any and all lands which the owners thereof shall elect to devote exclusively to growing trees of such species as are suitable for merchantable lumber. This valuation to be made every ten years, and in no case to be any greater per acre than the lowest valuation placed by the assessors on any non-agricultural, barren, treeless or waste land of any sort within the

county. An appeal to the court from this valuation shall be allowed any landowner, and, upon hearing, the court shall have power to determine the sum.

If any landowner, whether nonresident or resident, shall elect to devote any portion of his land exclusively to tree-growing for commercial purposes he shall give notice, in proper form, to the assessor of the district in which such land shall be located, and the assessor shall at once report the same to the county commissioners, who shall promptly lay it before the judge of the Court of Quarter Sessions of the county. Thereupon the court shall call upon the Department of Forestry of the State to appoint an expert in forestry, who shall at once examine the premises and decide whether they are suitable for growing trees of such species as will make good, marketable lumber, and to decide what species of trees shall be cared for, if any such are growing on the land, and also to decide what additional ones, if any, must be planted, and in all cases to determine how many and what species.

If the report shall be favorable, and the landowner become obligated to the county to conduct tree-planting and tree-growing on said land in accordance with the directions and conditions which the Forestry Department may formulate and exact, then, when so planted or devoted to tree growing, said land shall not be assessed at a higher rate nor taxed more per acre than the valuation set upon it by the board appointed for that purpose or the court, on appeal, had fixed, until the trees growing thereon shall be large enough to produce good, merchantable lumber and cut therefor. In case of planted trees this period of time shall not be fixed for less than forty-five years, except where quick-growing trees shall be raised for other purposes than sawed timber.

If, at any time, the owner of any such land shall fail to maintain, in some stage of growth, such a number of trees as the Department of Forestry shall deem requisite—a designation of such number to be furnished the county commissioners—then the land shall be removed from the list of tree-growing lands and subject to taxation as other lands in like condition are in the county.

Whenever the owner of any such tree-growing land shall deem it desirable to cut and remove any or all of the trees growing thereon, he shall apply to the commissioners of the county for a

valuation of such timber trees growing thereon as he shall elect to cut and remove for use or sale, and on such removal he shall pay to the proper collectors a total tax of not more than two per cent. on the sum fixed by the county commissioners. Appeal to the court from this valuation shall be at all times a matter of right.

If any trees shall be removed at any time in order to permit a better development of those remaining, the value of the trees so removed shall not be liable to any tax unless the value in the vicinity shall be more than the cost of removal or sale, nor shall such firewood as may be necessary for use in the owner's house, or the house of any tenant thereon, in his service, be liable to any tax.

The tax which may fall due at the time of cutting of said trees shall be a lien upon the same, and upon the land upon which they grow, and when the same shall be cut and removed the tax must be paid by the party so cutting and removing them.

Much detail is necessarily omitted in the foregoing, the object being to show, in a general way, a method to relieve tree-growing land from unjust taxation, yet give to the public fund its due and equitable proportion of tax on property when that property becomes of merchantable value, but not before.

If putting a tax on timber when sold shall not be thought advisable, then when the trees shall arrive at an age when some can be profitably removed for sale, say at the age of forty-five years from the time of planting or electing to care for growing trees for lumber that may be growing on the land at such time, a certain portion of said land may become taxable as timber land now is. If, on arriving at the age of forty-five years, one-twentieth shall be set apart for such taxation, and a twentieth each year thereafter until all shall become taxable, an age of sixty-five years will be reached. Some of our timber trees will have then arrived at a suitable age for the manufacture of lumber; but if the owner shall not then elect to cut the timber he will be paying taxes on his land same as now. In this system there should be no tax levied when the timber is cut, for the tax began before that was fit and suitable for lumber.

But it may be said that in both these proposed systems the timber has all the time been growing in value, but has paid no

tax. True, but it has all the time been costing its owner money—the use of money invested in the land and in the planting of trees and caring for them, and he has received no revenue—nothing to pay taxes with. The same can be said of buildings or constructions for any purpose which may be going on for the improvement of property. But who claims the right to tax such improvements until completed, providing they are pushed forward to completion as rapidly as possible?

To suppose that our national and State governments will be able, from their limited holdings, to supply this country with the requisite amount of timber that our civilization demands is to suppose what can not occur. Individuals, municipalities, corporations, companies and trustees of estates must engage in tree-growing, and that speedily, or there will be so disastrous a timber famine that the car of progress in this country will not only not advance, but will go backward. Some relief and protection to tree-growing must be given or it will cease. Whoever may engage in it will suffer enough in waiting for it to mature and in tying up money invested in the enterprise, and should be exempt from taxation in any form. Full relief can not be given under our Constitution, and it should be amended. It should conform to the changed condition of things. With us tree-growing is new. It is unlike any other enterprise, because of the long period of time taken to bring returns. At present only such relief as has been here suggested, or in some other form which will prevent confiscation, can be given by our State. But the government of the United States can and should aid in the matter. A bounty on tree-growing would be of far more benefit to the country at large than a bounty on beet sugar, and a free distribution of tree seeds and young trees of equal, if not greater, benefit than free garden seeds.

Note.—Since writing the foregoing, I have discovered that Dr. J. T. Rothrock, former Commissioner of Forestry of Pennsylvania, now of the Forestry Commission, held substantially the same views of the injustice of taxing growing timber that I have set forth. This he did in an article entitled "Vanishing Industries," published in the Report of the State Board of Agriculture for 1894, page 223, a part of which is here given. I make this reference with great pleasure, as he thus saw, in the early days of the forestry movement, what must sooner or later be met. I was not aware of this declaration by him when I sent you the article, or I

most certainly would have given credit to this worthy pioneer, whose clear vision saw what should and must be done.—S. B. Elliott.

“As for the taxation of standing timber, one may as well come out on a distinct platform at once; it is a wrong, both to the owner and to the commonwealth, but chiefly to the latter. It is false in principle, for it taxes a man for a benefit which he has not yet received. If a timber owner holds land twenty years and then sells it at an advanced price, he then receives his increment and income, for both of which he should pay. So also he should when he realizes on his investment by cutting the trees. But, taxing standing timber is not only false in principle, but is pernicious in its results, because it is confiscating (practically) the lands, to avoid which the owner cuts the trees, and so inflicts an injury (as things now are) on the State. There are known methods of doing this.

“It is objected that if growing timber is exempted from taxation it would work a wrong to the poorest counties, because it would leave them without requisite funds for opening and repairing roads. This, of course, would be bad enough, but is it any more than taking the taxes and failing to repair the roads? The argument may prove too much.

“Let us look just a little down into the future: This good-road question is a rising one. It will not down. It has come to stay, and we may frankly meet the issue. The State requires ready means of communication from place to place. Without them we should be largely at the mercy of the railroads. In proportion as these are good we are less dependent of the railroads.

“Now, is it not possible that we should be taking a step on which the wisdom of the future would pronounce favorably if we were to do this?

“Remove the tax from standing timber until it is sold and cut. And whatever revenue a township loses, by thus exempting the timber, let the State restore, to be expended under competent supervision in maintaining a proper road system in that township.

“It will be observed that this grants the largest aid just where need of development is greatest, and that the State helps itself as much, or more, than it helps the townships.”

Huge Consumption of Wooden Fence Posts.

In the Middle West, Where Trees are Scarce. It Will Pay to Grow a Supply.

The difficulty of obtaining fence posts at reasonable prices has given an impetus scarcely realized to forest planting in the Middle West. Newspapers, farmers' institutes, women's clubs, and boards of trade throughout the region are pointing out the need of such material, and dwelling on the profit realized by the few men who planted trees years ago and whose plantations have been successful. The local supply of all forest products is insignificant, and timber, if not grown at home, must be imported. With the continuous retreat of the sources of supply under the attack of the vigorous demand, the length of the haul increases and the cost of transportation rises higher and higher. Yet the fields and pastures must be fenced. The posts must be had.

The annual production of fence posts in the regular logging camps of the country, as reported by the last census, is 8,715,661. How many times greater than this is the annual cut from the home woodlot no figures exist to show; but by taking the total number of farms and their acreage and making a conservative allowance for posts for the fences inclosing each farm, it has been estimated that upwards of 1,000,000,000 posts are set each year. Such figures are too vast to mean anything. Even the nine million posts of the census, a mere drop in the bucket as compared with the unreported production, would, if set 15 feet apart, girdle the earth, or would build a solid pile 55 feet wide, 40 feet high, and a mile long.

Durability and at least moderate strength are the desirable qualities for fence posts. The use of species which are not durable is expensive, both on account of the more frequent renewal which is necessary and because repairing is constantly called for. Timber of the required quality is produced in the Middle West by hardy catalpa, black locust, and Osage orange.

Catalpa makes an excellent growth on deep, porous, fertile soil,

but only on such soil. Five or six inch posts should be ready to cut in about ten years. In regions immune from the locust borer black locust will yield satisfactory returns from soil in which catalpa would fail, and for this reason it is adapted to a wide area where the rainfall is light. Under ordinary conditions, locust should produce fence material in fifteen years.

Osage orange is not exacting in its soil requirements. It is being extensively planted for hedges and windbreaks, from which a considerable yield of fence posts may be obtained. It makes satisfactory growth on dry soils, and reaches post size in from fifteen to twenty years.

Several other species, such as white willow, European larch, Russian mulberry, and red cedar, are also being grown with good results, but none of them is better fitted to supply fence posts than those first named.

The Forest Service fully recognizes the importance of fence posts in farm economy, and the great demand for suitable timber. Studies of the growth and durability of various species have been made, and the limits of the commercial planting range of each has been more closely defined. Rapid-growing species which are not durable have been studied to determine some form of preservation treatment which will increase their durability. Further work along this line will undoubtedly add largely to the list of species which can furnish the desired product.

Nut Growing and Forestry.

BY LESLIE HARRISON.

One of the main causes working against the immediate adoption of forestry is the distant future of the returns. American civilization lives too much in the present, and it is hard to persuade the average man to sacrifice himself in the interests of a posterity some generations removed.

But there are certain trees which are now and always will be valuable for their timber, and which also bear paying crops long before they are available for the sawmill. Chief among these are the chestnut, walnut, and hickory. There are a number of other valuable nut trees, but their cultivation has come into the realm of the orchardist, as is notably the case with the so-called "English Walnut" and almond in California, and the pecan in Texas.

Little has yet been done in the improvement and cultivation of our native nuts, especially those borne on valuable forest trees. Much attention has been given to the orchard varieties, but when our indigenous nuts have been improved it is probable that they will be even more in demand than some of the more important carefully cultivated nuts of the present day.

The chestnut has received some attention, particularly in Pennsylvania and New Jersey, and it is deserving of considerable more, for its main value lies in the fact that it can be used on rough upland country where the possibility of other crops would be at a minimum. Moreover, it has been successfully demonstrated that imported and fancy varieties can be grafted onto native hardy stock to produce fine nuts in great profusion. The different kinds of hickory and walnut need lower lands, but even these trees can be successfully grown in bottom lands whose frequent overflow renders them unfit for farming purposes. While these varieties are growing they are not only producing a valuable timber stand for the future, but in the present they incidentally

furnish a valuable by-product in the nuts grown, making such plantations valuable properties long years before they mature for lumber. By this plan annual harvests will pay the expenses of forest operations, and the man who plants these hardwood trees has a reward in addition to the feeling that his children will have a valuable inheritance in the timber.

Mr. E. A. Sterling, of the U. S. Forest Service, in a report furnished to the New York Forest, Fish, and Game Commission, recommends highly the cultivation of chestnut groves, basing his recommendation on actual observations of groves in New Jersey and Pennsylvania. In these two States chestnut culture has been tried in two ways; in groves of actual forest growth under forest conditions, and in orchards under orchard conditions. The former method is a complete success, and in its utilization of waste land takes nothing from areas which otherwise might be profitably devoted to the cultivation of other crops. In the latter method the chances of failure seem to be greater, and in case of a failure there is not only the loss of the crop itself, but the loss of the use of the ground on which the attempted crop was grown. The most successful method in use was the grafting of Japanese, European, or desirable native varieties on the coppice growth on cut-over chestnut lands, thus insuring in the second growth a maximum annual crop value in a minimum time.

It has been found that the Paragon is the best variety for grafting, and these will be in bearing in four years, with an annual increase in the value of the harvested crop. There is no trouble in disposing of the yield, as the demand is far in excess of the supply. The best Paragon nuts sell readily at prices averaging \$10 per hundredweight, and a usual price is \$7 per bushel. While the trees do not produce phenomenal yields in their early years, especially if many of the burrs are removed in order to get improved quality and size of nuts in the remaining ones, still the yield of older trees is enormous, single trees giving \$40 worth of chestnuts.

It is probable that the success attained by the Pennsylvania groves will tempt others to make use of worthless old hillsides to produce a crop of nuts as well as timber, and under such conditions the work forms a branch of forestry rather than horti-

culture, since the essential elements of the forest are all there. More than that, chestnut culture should go a long way in solving the problem of reclaiming worthless burned and waste land, which at the present time is a standing menace to surrounding forests. In addition to this it provides for a more complete utilization of forest areas.

Suggestions for State Forest Fire Laws.

BY E. J. CHEYNEY.
Minnesota Experiment Station.

The forest laws of most of our States are far more impressive in the reading than they are effective in the application. There are at least three glaring weaknesses—almost universal in their occurrence—the correction of which would make all the other shortcomings of the laws seem trivial indeed.

In the first place, the legislatures—led by what is probably a false idea of economy—would all seem to have the bee by the wrong end. The laws are nearly all directed toward the fighting of fires which have already started in the woods, providing dire punishment to be visited on the heads of those who are supposed to have set such fires, and giving promise of horrible things which will be done to any district attorneys who do not properly prosecute such offenders. To this end a grudging and usually inefficient appropriation is made for fighting fires. Many of the laws simply appoint fire wardens, without pay, empowering (?) them to fight fires and hire help for that purpose, without making any appropriation whatsoever.

These laws are a good thing. Not only does it show that people are waking up to the necessity of such things, but they are of practical value in providing men where they are very badly needed. It would, however, be much better to look to the prevention of fires, so that there would be no necessity of fighting them. The old adage that an ounce of prevention is worth a pound of cure applies nowhere better than to forest fires. And would it not be possible to bring this about with little or no increased expense to the State?

Under the present system a fire warden is paid only for the time spent in actually fighting the fire. He can not afford to neglect his own work to look for fires in the places where they are most likely to occur, nor even to waste an afternoon in hurrying to inspect a rumor which may turn out to be a false alarm, and consequently no pay. In this way a fire almost necessarily grows to dangerous proportions before anyone can afford to take any

notice of it, and a large number of men are then required to fight it.

Every forest fire has a small beginning, and a very large per cent. of these beginnings would be found by a man who was paid to look for them; and would be found in such time that he could put them out alone with the aid of one or two helpers. Without looking into the value of the property which would be saved in this way, it is an open question whether a paid regular patrol would not nip in the bud a sufficient number of fires to make that plan actually cheaper than paying the crowds of temporary laborers who have to be called in at extra high wages to fight the fires after they have gotten well under way. For example: It would not require a very large fire to force a warden to hire thirty men for two days at \$2 per day. One hundred and twenty dollars is spent in putting out this one little fire, which has, nevertheless, done considerable damage before it was gotten under control. That \$120 would pay one man to patrol a large territory for three months of the summer danger season—April, May, and June. Such a patrol would probably have caught this fire—together with dozens of others—in the incipient stage, saved several thousands of feet of lumber, and the expense of several hundred fire fighters.

That millions of feet of timber would be saved in this way is beyond question, but would it not also be cheaper in the actual cash outlay?

APPOINTMENT OF WARDENS.

Another mistake, though not nearly so important as the first, is the appointment of elected men, such as the Selectmen of a town, to the position of fire warden. A man will not leave his own work to go fight a fire on some one else's ground and probably for some one else's benefit unless he has to, and forcing men to do such things is not a business calculated to make a man popular. Consequently the elected fire warden is not going to do it, or can he be greatly blamed for refusing. He does not care about losing the position as fire warden, but the more paying or more honorary position by virtue of which he is a fire warden. One or two of the States have realized this and found a very good solution of it in the appointment of the wardens by the courts.

THE MATTER OF PAY.

This difficulty which the fire warden has in obtaining aid in time of fire—a question which seems to puzzle some people unduly—is the result of another great weakness in the fire laws. They usually offer higher pay than is given for other work, but men do not volunteer for their work. The causes are not far to seek. The job is a peremptory and temporary one—which does not matter so much, though both these characteristics go against the grain of the average American—and the pay comes somewhere in the far future—which matters a great deal. To the class of men hired on such occasions pay in the future is no pay at all; they would rather work for fifty cents and get it at once, than for two dollars to come a month hence. And lucky is the man who gets his money through the government red tape in a month! The Pocono Protective Fire Association, in Pennsylvania, though they do not pay as high wages as the State, have no trouble in getting men for this work, because they pay cash. This has been pretty generally acknowledged as a great fault, but nothing has been done to remedy it.

I would like to suggest the following plan: The length of time taken to get the money from the State treasuries is largely the result of the cumbrous working of those institutions, and therefore unavoidable. But why not have a sub-pay station in the shape of the small country stores? Arrangements could easily be made with such stores, without expense, to credit the order of the fire wardens. These orders could be made out on the grounds immediately after the work was completed, taken to the neighboring store, and there either exchanged for cash or credited on the books. The stores would be willing enough to do this for the increased trade which it would inevitably bring them, and could wait for the slower pay of the government. Probably many orders are now cashed at the stores at a tremendous discount; an agreement between the store and the State would secure full pay for the holder. To make this system secure against leakage the wardens should be paid and bonded men, but the small amounts of money involved and the caution of the stores would act as a pretty good check on any fraud.

This would seem to be the most effective way of bracing up a weak system, which is the next best thing to getting a new one.

The Rise in Lumber Prices.*

BY R. S. KELLOGG.
U. S. Forest Service.

Ours is pre-eminently a wood-using civilization, and aside from food and clothing, no material is so essential to industrial progress as wood. Nature provided us with immense areas of easily accessible, highly valuable forests, and we have drawn upon them with so lavish a hand for every conceivable purpose that we are loath to believe that the time is rapidly approaching when our remaining forests must be handled constructively and not destructively; or else wood of the higher classes will be obtainable only in insufficient quantity. According to the census of 1900, which was admittedly incomplete, we were then using annually thirty-five billion feet of lumber, and now the amount is probably nearing fifty billion feet. Yet how many of you ever stop to consider that the lumber cut is much less than half of the total annual drain upon our forests? The pulp mills take some 2,000,000 cords of wood yearly, the tanneries 1,500,000 cords of hemlock and oak bark, the cooperage industry a vast amount of timber, the railroads about 115,000,000 ties for renewals alone, and then there are millions of posts and poles to be added to the total before we even come to the half of our wood consumption. The census of 1880 showed that the wood used for fuel at that time amounted to 146,000,000 cords, and there is no reason to suppose that, despite the great increase in coal consumption, the 85,000,000 people of 1906 are burning less wood than did the 50,000,000 of 1880.

All these items, huge though they be, belong to necessary demands upon the forest. We are a rapidly growing nation, and we have seized upon every available resource to aid in our growth. Though the forests have been destroyed, they have yielded rich returns. Yet there is another drain upon them, which has been wholly harmful. This is fire. As a single example: The sec-

*Paper read at the Sixteenth Annual Meeting of the Southern Lumber Manufacturers' Association at New Orleans, January 23, 1906.

retary of the Pacific Coast Association recently stated that during the last fifty years there has been 900,000 acres more timber burned over than cut over in Oregon.

In the early days New England was the great lumber region. Then came the Lake States with their supposedly "inexhaustible supply" of timber. This was said thirty or forty years ago. Now, Michigan is a practically negligible factor in white pine. Wisconsin is on the wane, and it will not be many years until Minneapolis and Cloquet cease turning out a million and a half feet each daily during the sawing season. Southern yellow pine is at present furnishing in the neighborhood of 30 per cent. of the total lumber supply, but it in turn will yield to the Pacific Coast woods; and we have finally come to the realization that the so-called "inexhaustible supply" is a pleasing, but most dangerous misconception. Exploitation has been so easy, invention has supplied so many ingenious methods of converting trees into lumber, that the output from a given region is maintained at a high level until the supply is close to the point of exhaustion. We are nearer a halting place than most of us realize.

What is the condition confronting the lumberman and the user of his products today? Dr. Fernow states that an "extravagant estimate" of our stumpage is not over two trillion feet standing on some 500,000,000 acres. At the present rate of sawing this will be cut in forty years. This does not mean that forty years hence there will be no more timber to saw, but it does mean that there must come a great readjustment to new conditions by both the manufacturer and the user of forest products. So far we have been drawing on the older trees in our forests, or cutting virgin stands anywhere from 100 to 500 years old. In other words, we have been paying dividends out of our capital stock, and no good business man will do that. In the near future our wood must be supplied by growth and reproduction, and the now commonly despised "second growth" will come to be our source of supply.

Going back to our estimated forest area of 500,000,000 acres, let us see what can be done with it. Of this 500,000,000 acres, the government has nearly 100,000,000 acres in national forest reserves, but a considerable portion of this area lacks forests of

any value for lumber. Four-fifths of our forest area is in private hands, and quite likely will remain so for at least a long time to come. The highly managed forests of Germany grow, on an average, about 50 cubic feet of wood per acre annually. Were our forests in the condition of the German forests, their extent is barely sufficient to furnish by annual growth the amount of wood we now use. As a matter of fact, the annual growth of our forests as a whole, under present conditions of abuse, is probably not more than one-fifth that of the German forests.

These, then, are the conditions as nearly as can be estimated today. It does not require any special gift of prophecy to outline what will follow. We will undoubtedly go on in the same old wasteful, extravagant way, for some years yet, until there comes a stern realization that things must change. And when I say a "stern realization," I mean one which is caused by a greater scarcity of stumpage and a much higher price for lumber than now exists. Then we shall begin to husband our resources, and make one board do where we now use two. Undoubtedly we are approaching the maximum of our annual consumption of forest products, and hereafter the great increase will be in value instead of quantity. It is entirely possible for us to use less wood, and we shall do so when we have to. We are consuming some 500 board feet of lumber, per capita, annually, where Europe uses but 60; and if we were forced to import 80 per cent. of our wood supply, as does France, or practically all, as does England, we should quickly learn how to economize. We are not likely to reach this extreme condition, but we may be sure that prices will advance until consumption is finally forced down to somewhere near the annual accretion of the forests that are left at that time.

I do not decry high prices, much as the country has benefited by low prices for lumber. I recognize the fact that in general the lumbermen have operated as economically as they could under prevailing conditions, and while it is fashionable to condemn them for destroying the forests, they have done so only because of economic demand, and their critics would have behaved no better under the same circumstances. But the forests will not be handled rationally until they become valuable, until there is money in handling them that way; and so I say that from the standpoint

of the forester, high prices for lumber are a good thing, because they make it profitable to utilize the forests rationally and economically. One of the prominent Pacific Coast lumbermen recently advised his associates to "slab lightly, reduce your saw kerf, and keep your eye on the burner." Carrying this a little further, it will not be long until the slabs are resawed and the burner abolished entirely, as the white pine manufacturers are now doing.

In view of these conditions, there is nothing really surprising in the fact that in the last twelve years the price of rough white pine uppers on the Buffalo market has risen from \$47 to \$91, or 94 per cent.; that select cypress on the New York market has risen from \$30.50 to \$42.40, or 39 per cent.; that hemlock, Pennsylvania stock, at New York, has risen from \$11.40 to \$22.25, or 95 per cent., and that according to your price lists, "A" flat-grain yellow pine flooring was quoted at \$16.50 in 1894, delivered on a 22-cent rate, and at \$29.50 in December, 1905, delivered on a 23-cent rate, or a raise of 77 per cent. Of course, I understand that there are a number of factors entering into the case, and am not overlooking the influence of the general rise in the price level during the past few years, the abundant crops, and the great building activity, but it requires more than these things to explain why it was that your Committee on Values issued six price lists in the effort to keep up with the market last year, and that there is little sagging in the latest list during this winter. It is entirely possible and even likely that there will be temporary halts and even depressions in prices of lumber, but there is every reason to believe that the upward course shown by the price-curves for the last dozen years is but the beginning of a general advance which will continue until an equilibrium between the demand for wood and the amount available for the yearly cut is reached on a far higher price level than at present.

Recreation and the Forest.

Men work that they may enjoy leisure, and make money in order to spend it. This is not, perhaps, the normal and proper state of affairs, and it may be that work for its own sake should bring rewarding enjoyment. But as the world goes, work may mean overwork, or work without real choice or aptitude, so that what might otherwise be a pleasure is too often a dry task. Recreation, therefore, though it takes up but a short span in the course of a lifetime, is cherished in proportion to its brevity. If the world had no natural recreation grounds the ordinary man would lack incentive to labor, except to supply the bare needs of existence. For the play instinct, the delight in free activity for its own sake, especially in the great outdoors, is as old as the race and one of its best inheritances from its prehistoric ancestry.

The forest is the most ancient and momentous of human dwelling places. Ever since men, in caves and trees, learned, even among dangers, to regard the forest as a home, the shadows, the silence, the excitements, and the fascination of the forest have stirred the strongest feelings of the race. Dread of the forest, its incentive to achievements, the sense that within it all things good and evil were to be found and treasured or encountered and overcome, have left an indelible impress in the minds and hearts of men.

In primitive days, when the business and risks of life were over for the day, the stern and impressive realities could be rehearsed by the hunter and his children in the mimic world of play. Nowadays, the ordeals of our forest ancestors have become all play. Hunting, picnicking, canoeing, fishing, tramping, the tent life and the roaring campfire are all survivals of the life of the Forest Age, reminiscences coursing in the very blood of our civilization and carrying us back to the times when danger was a part of the day's work and successful craft against bird and beast and fish was the first condition of existence. Recreation in the forest is the pleasant recall, in imagination, of a life vivid, fresh,

free, and heroic. This life, now lost to us in the humdrum barter of the market place, may be brought back by the power of money, to amuse and invigorate and thrill us yet in our short hours of leisure and liberty.

How highly this reversion to the old life is treasured may appropriately be measured, in these times, by the sacrifices men make, the money they spend, for a summer's outing beside forest and stream. In New Hampshire, for instance, about half a million dollars are spent each year by the summer visitors, whose choice of this region is based upon its fine woodlands and lakes. Of the 174,280 persons spending their summer there, in the latest year for which figures are at hand, only about one-tenth (20,352) occupied cottages for the season, while a third remained but a week or so, and more than half (95,706) remained less than a single week. The cash received from these people, in the same year, was almost \$5,000,000, and the total amount of this business added to the capital invested in summer resort property exceeded \$10,000,000.

Had the forests been destroyed or disfigured by wasteful logging, probably not one cent of this large income to the State would ever have been spent. Common sense, not sentiment, must make the strongest protest against any use of the New Hampshire forests, save one consistent with retaining forever the attractive power of the whole region for those seeking recreation. Of course, this "summer people" revenue is only a subsidiary affair in a business sense. The forests are chiefly valuable there, as elsewhere, for their ability to supply use and profit in the concrete of wood products. But the two values, the commercial and the pleasurable, may be secured together. The farmer whose yearly income is greatly augmented by the recreation his guests are sure to find in the forest which he owns, need not withhold the axe altogether. His woodlot may be made to pay by oft-repeated cuttings, which yield wood for home use or for market, without so thinning the stand as to mar the shade or pleasantness of the picnic grounds. Besides, by clearing the woodlot, though the first returns would be greater, he would have to wait long for further revenue; not only would he, in effect, turn away the paying guest, but he would discount the future.

Rules for the farmer's woodlot management in this region would be to avoid cutting of any kind during the summer outing season, to have strips of woods along the roads, to leave undisturbed the favored picnic grounds or places of special interest, and, in general, to avoid as far as possible, the clear cutting of any tract.

The same principles hold true even more emphatically of larger lumbering operations. These should go on; they yield a good part of the State revenue. But if pushed recklessly, as too often in the past, they will not merely invite their own end, but will put a stop to the quest for recreation in the New Hampshire hills. Moderation, wise and foresighted lumbering, will preserve both the direct and the indirect sources of revenue, and time will constantly add to their amount.

All this, which applies to the pocketbook alone, is important enough to lead to wise action without further discussion. But there is a broader argument of general policy which may be used in defense of the New Hampshire forests. Recreation grounds in the East are limited. More and more, as the cities swell, and the pressure of industrial life becomes severer, it is of the highest common concern that nature be safeguarded and encouraged in her beneficent work of building up and sustaining the great world of Recreation, in which care is thrown aside, and cramped limbs, bent shoulders, and weary brains may find freedom and invigoration. The forest for recreation has become a much needed investment in the interests of the whole community.

Forest Resources and the Public Welfare.

An Address Made Before the Annual Kentucky State Development Convention, Winchester, Ky., October 12, 1906.

BY HERBERT A. SMITH.
Editor, U. S. Forest Service.

We have lately passed through a half century of industrial development almost unparalleled in human history. In 1850 our population was 23,000,000, in 1900, 76,000,000. In 1850 our farm acreage was less than 300,000,000, in 1900 over 800,000,000, while the value of our farm property was less than \$4,000,000,000, as against over \$20,000,000,000 at the latter period. Our manufactures make a still more remarkable showing. The wage earners employed have risen from one to five millions, while the capital invested multiplied twenty times in the half century—from \$500,000,000 to nearly \$10,000,000,000. It is chiefly within this half century that our railroads have spread their network over the land, and steam has revolutionized the whole world of industry. In brief, then, these fifty years have seen an immense expansion of agriculture coupled with the sudden growth of a colossal manufacturing interest, and naturally along with these an accompanying development of transportation.

Who can doubt as we seek to read the future in the light of the present, that the first half of the twentieth century will see a progress equally notable? By 1950 we bid fair to be a nation of 200,000,000 souls. We have covered the land with our farms, yet it is now apparent that we have no more than scratched the surface of its productive power. By the use of irrigation we may plant empires in the desert, while by improved methods of cultivation we have it in our reach to increase the yield of our present farms many fold. Our manufactures are still increasing at a rate that staggers the imagination to keep pace with, and instead of having to supply our needs from other countries we are invading the markets of the world. Electricity promises to rival in the next half century the marvels which steam wrought in the last, while our vast supplies of iron and coal, the two main pillars of

present-day industrial supremacy, insures us such an immediate future as no other nation can hope to rival.

Yet there is another class of considerations which demands our attention. One of our most sagacious men of affairs has lately been calling to our notice the danger of exhaustion of many of our resources upon which prosperity depends. The very rapidity of national growth of which we are assured—which we can not escape—enhances the danger. By the end of the half century our vast deposits of iron will (so it is said), under the accelerated drain, have been very largely reduced. Our dwindling forests have already begun to harm the industries dependent on them. Our coal, the chief source of the power which drives the wheels of industry, can never be burned but once. Can it be that the vast rising structure of our industrial life is consuming its own foundations and is doomed to eventual downfall?

That same sagacious man of affairs to whom I have just referred—Mr. James J. Hill—has pointed out the distinction between our lasting and our transitory sources of prosperity. Our farms belong in the first class; our mines in the second. Every ton of ore taken from our mines is like money drawn from a bank account; when it is used it is gone. For stable and permanent prosperity, if our national greatness is not to fall into an early decay, we must look to those sources of wealth which are capable of utilization without impairment of their productive power.

There is a fundamental difference between utilization and exploitation. Mere exploitation brings temporary enrichment followed by permanent impoverishment. Exploitation is too often regarded as development. True and lasting material development depends on our learning to make the most of every natural resource. Undeveloped, our resources are but potential wealth. The greatness, prosperity, and power of our country, and with them our own individual welfare, depend on our learning how to utilize to the fullest every natural resource.

Of these natural resources our forests constitute one of the greatest. Hitherto we have abused this resource shamefully. We have exploited it. With the prodigal recklessness born of abundance we have taken what we needed and destroyed much more than we have used. It is now plain that the day of reckoning is not far distant. Not our children, but we ourselves, are likely

to have brought forcibly home to us the evil consequence of our shortsightedness.

In this problem forestry plays an important part. A considerable portion of our land is by nature fitted to serve its best use as a source of permanent supply of wood and water. In mountainous regions wood is the only crop which the soil is capable of producing, but it is not merely in the mountains that the natural forest land is to be found. Even in our richest agricultural regions there is usually to be found more or less land too rugged, steep, wet, or infertile for agriculture. Eventually the woodlots of the American farmer will furnish us with a large part of our wood supply.

The Department of Agriculture exists at Washington to promote the best use of all kinds and classes of the land which forms our greatest national asset. The problem is essentially the application of the highest intelligence and fullest scientific knowledge to the work of making our land yield its utmost. The Department of Agriculture seeks for the farmer new crops, better seed, better methods of cultivation, improved methods of breeding and caring for stock, information as to how to market his product—whatever can make his farm more profitable. In doing this it is adding enormously to the capital value of farm lands.

It is no new statement, but yet it is one that can not be made too often, that wood is of basic importance in our industrial life. Other materials can not do away with the need of it. There is no great industry for which it is not important.

Take the case of Kentucky. More than one-half of her area is wooded. Lumbering adds yearly to the wealth of the State an amount which places it second among her great industries. Yet this is only a beginning. Kentucky is rich in coal, but coal can not be mined without a large supply of mining timbers. In many places the coal mines have already largely drained their supply of timber, and the management of the Cumberland Mountain forests for the production of such timber will probably furnish their best employment, and will be necessary in the interest of the mines themselves. The same thing is true of the railroads. Every tie laid in the track requires on the average two trees growing in the forest to keep it there. Through the northern part of the State the production of railroad ties from timber tracts and

woodlots will assuredly be one of the most profitable ways of utilizing the forest, and special studies along these two lines, mining timber and tie production, in these two different parts of the State, would therefore be of great value. By far the greater part of the lumber produced in Kentucky is hardwood, of which oak constitutes a large part. Upon the supply of this depend many industries. Distributed through the State are to be found vehicle factories, handle factories, tight and slack cooperage plants, box factories, veneer mills, and wood distillation plants. The manufacture of carriages and wagons alone represents an aggregate investment of over \$4,000,000. The cooperage industry in Kentucky produces more tight barrel stock than any other State in the Union.

Forest destruction is already threatening the future of these industries. Recent reports from the National Tight Barrel Stave Manufacturers' Association show that their timber today is costing nearly four and a half times what it did ten years ago. The handle factories of Kentucky use large quantities of hickory. Only this week the papers announced that the scarcity of hickory timber was the chief subject of discussion at the opening of the annual convention of the National Association of Implement and Vehicle Manufacturers. These manufacturers see the need of the supply of hickory already in sight.

Industrial development throughout the South is now recognizedly dependent in large measure on the development of the water power furnished by the streams descending from the Southern Appalachians. Forest destruction has already sensibly begun to affect these water powers. A measure to establish a national forest reserve which will put a stop to this destruction and benefit at once the consumers of wood, the users of water power, the agricultural interests affected by the floods in nudation, and the harbors and navigable inland waters now injured by the deposits of silt and sandbars, was passed by one branch of Congress at its last session, and now awaits the action of the other branch. From the forester's standpoint there can be no question that this legislation, if enacted, will beneficially affect the development of every State which borders on the reserve. It is to be hoped that this reserve will include some part of Kentucky.

But the State needs more than action by the National Govern

ment. If her forests are to play their proper part in contributing to her welfare, the private owner must be informed before it is too late how to make the most of what he has. The forests must not be left to take care of themselves. Trees are a crop as truly as corn and tobacco, and must be cultivated by the methods which will bring the largest yield. Of these methods the ordinary owner, particularly the small owner, is ignorant. He is ignorant also of how to dispose of his property to the best advantage. The large owner can generally be depended upon to take care of himself. A wise State forest policy might well begin with a study of existing forest conditions and existing markets, which would throw light on the important problems of management. Such studies have already been made in other States, notably New Hampshire and California, in coöperation with the Forest Service of the National Government, which stands ready to coöperate with any State by sending its experts to conduct such a study. After the study is made the way is clear for formulation of the policy which will best serve the interests of the State.

The last resort, public opinion, the intelligent interest of the citizens, is the force which, if brought to bear, will work the greatest good for the forests of Kentucky. To inform and strengthen this interest in forest problems every channel of information should be opened.

This campaign of education is needed to secure certain definite, practical results. The essence of the matter lies in a nutshell. Over one-half of Kentucky is wooded, and most of this land can have no permanent value except to produce wood, which the manufacturing interests of the State can not do without.

The question is, shall much of the State be permitted to become waste, and worse than waste, land, untaxable, stripped and abandoned and pouring down ruin from its gullied and washing slopes, and shall much more produce only a scant and inferior yield of material worthless for the wood-working industries, and hardly worth cutting, or shall every acre of the commonwealth contribute its share to the general welfare and its full profit to the owner, yielding its present harvest of mature timber without injury to the younger growth, and intelligently directed to the production in largest possible quantity of the best paying and most needed kinds of wood?

TWENTY-EIGHTH ANNUAL REPORT

OF THE

Indiana School for Feeble- Minded Youth

FORT WAYNE, INDIANA

For the Fiscal Year Ending October.31

1906

TO THE GOVERNOR

INDIANAPOLIS:

WM. E. BURFORD, CONTRACTOR FOR STATE PRINTING AND BINDING

1907

THE STATE OF INDIANA,
EXECUTIVE DEPARTMENT,
December 12, 1906. }

Received by the Governor, examined and referred to the Auditor of State for verification of the financial statement.

OFFICE OF AUDITOR OF STATE,
INDIANAPOLIS, December 24, 1906. }

The within report, so far as the same relates to moneys drawn from the State Treasury, has been examined and found correct.

J. C. BILLHEIMER.
Auditor of State.

December 24, 1906.

Returned by the Auditor of State, with above certificate, and transmitted to Secretary of State for publication, upon the order of the Board of Commissioners of Public Printing and Binding.

FRED L. GEMMER,
Secretary to the Governor.

Filed in the office of the Secretary of State of the State of Indiana, December 24, 1906.

FRED A. SIMS,
Secretary of State.

Received the within report and delivered to the printer December 24, 1906.

HARRY SLOUGH,
Clerk Printing Bureau.

BOARD OF TRUSTEES.

JAMES W. SALE, President, Bluffton.

EDWARD M. WILSON, Treasurer, Fort Wayne.

MRS. MARY ROWAN HARPER, Secretary, Fort Wayne.

OFFICERS.

ALBERT E. CARROLL, Superintendent.

NORA GRIFFIN, Acting Matron.

MEDICAL DEPARTMENT.

CHARLES G. BEALL, M. D., Resident Physician.

CHESTER E. HULL, M. D., Medical Intern.

MEDICAL CONSULTING STAFF.

Surgery.

MILES F. PORTER, A. M., M. D.

Internal Medicine.

B. VAN SWERINGEN, M. D.

Eye, Ear, Nose and Throat.

KENT K. WHEELOCK, M. D.

ACCOUNTING DEPARTMENT.

JOHN A. ROSS, Clerk.

FRANK B. WILT, Bookkeeper.

MELVIN DRUCKEMILLER, Storekeeper.

T. N. SMITH, Storekeeper's Assistant.

JANE McCLELLAND, Stenographer.

CARRIE GRIFFITH, Night Clerk.

MARGARET TOWNSEND, Record Clerk.

SCHOOL DEPARTMENT.

CYRUS D. MEAD, Principal.

MRS. BLANCHE MACKELVEY, Kindergarten.

HELEN HUTCHINSON, Kindergarten and Primary.

MRS. MARTHA KIMBLE, Primary.

MABLE STINE, Primary.

GRACE EWART, Primary and Intermediate.
 MRS. ALICE SUMMERBELL, Intermediate.
 GRACE THOMPSON, Intermediate and Grammar Grade.
 MARY WINTERMOTE, Art and Grammar Grade.
 BERENICE WARREN, Needle and Lace.
 GERTRUDE HATCH, Sloyd and Clay Modeling.
 FRANCES CHAPMAN, Physical Culture.
 EMMA JACKLEY, Piano and Voice.
 GEORGE VON EBERHART, Girls' Orchestra.
 G. J. THOMPSON, Boys' Brass Band.

HEADS OF DEPARTMENTS.

WILLIAM J. SMITH, Supervisor Colony Farm.
 HARRY THOMPSON, Supervisor East Wing Boys' Ward.
 NORA GRIFFIN, Supervisoress West Wing Girls' Ward.
 ELLA M'CORMICK, Supervisoress Custodial Cottage for Girls.
 BELLA MACTAVISH, Supervisoress Cottage for Adult Females.
 EDITH WOOSTER, Head Nurse.
 LEW DEHAVEN, Chief Engineer.
 WILLIAM JUERGENS, Woodworking.
 WILLIAM MERTZ, Painting.
 HENRY MEURER, Mattress Making.
 FRED KOENIG, Tailoring.
 GEORGE HENDEE, Shoemaking.
 ANDREW HEINZLEMAN, Bakery.
 P. J. BOUILLON, Cold Storage.
 JOHN DICKSON, Farm and Dairy.
 FRANK WILHELMS, Garden and Grounds.
 JACOB BRETZ, Outside Overseer.
 KITTIE HARGRAVE, Laundry.
 ADA V. HART, Dressmaking.
 SUSIE CHAPPELL, Mending and Comfort.
 MAE BRECKENRIDGE, Sewing Room, Cottage for Adult Females.
 Mrs. M. M'LAUGHLIN, Sewing Room, Colony Farm.

REPORT OF BOARD OF TRUSTEES.

TO THE HONORABLE J. FRANK HANLY, *Governor of Indiana*:

Sir—The Board of Trustees of the Indiana School for Feeble-Minded Youth has the honor to present herewith its twenty-eighth annual report, including the reports of the Superintendent, Principal, and Physician, for the fiscal year ending October 31, 1906.

The personnel and organization of the Board remains the same as it was at our last annual report, viz.: James W. Sale, President, Bluffton; Edward M. Wilson, Treasurer, Ft. Wayne; Mary R. Harper, Secretary, Ft. Wayne. The school has made substantial progress during the past year. The educational department is in charge of a principal keenly alive to the needs of the children attending the school, and his efforts are ably seconded by a most excellent corps of teachers. We respectfully call your attention to his report showing the number of pupils attending the school and the work being done.

The progress made in both vocal and instrumental music has been extremely gratifying. They are potent factors in arousing and holding the attention and interest of the children. The band, the girls' orchestra and the singing classes have afforded much pleasure to all who have heard them. The industrial departments are under the control of persons well qualified to train those under their instruction in the various kinds of work. Altogether 185 boys and 300 girls are receiving industrial training in the different departments.

The school has been free from serious epidemics during the past year and the death rate has been remarkably low, being only 1.86 per cent., as against 2.5 per cent. in 1905, which was the lowest in the history of the Institution. The physical condition of the children reflects credit upon the physician and the management in general.

Each year we are confronted with a number of withdrawals of children from the Institution by their parents or guardians, and although in many of these cases the withdrawals are made against

the judgment of your Board of Trustees, yet we are helpless under the present law to avoid them. We would therefore respectfully call your attention to our earnest recommendation for a change in the law governing the admission of children under sixteen years of age into this Institution. We believe that the State should have the right of permanent supervision and that children should be placed in the Institution by commitment made by the Circuit Court of the county in which such child resides rather than by voluntary application. By doing this the Board of Trustees would become the legal guardian of the child so committed by the court and would be placed in a position to exercise its best judgment in permitting withdrawals from the Institution. We believe this change in the law would conserve the best interests of the State in caring for its unfortunate wards. We would also recommend that the statute be changed so as to define more particularly the class and type of defectives that shall be cared for by this Institution. Sec. 3, Act of 1887, says: "The purpose of this Institution shall be to care for, support, train and instruct feeble-minded children, the term feeble-minded to include idiotic, epileptic and paralytic children." At the time of the enactment of this law the State had no other institution in which the epileptic children could be placed, but we believe from this time on that the new Village for Epileptics should take care of all this class of defectives. The paralytic is not necessarily mentally deficient, and it is neither proper nor just that they be consigned to this Institution and surrounded by those who are mentally deficient.

The Sixty-third General Assembly granted a specific appropriation of \$7,000 for fire protection and the extension of water mains from the north limits of the city of Fort Wayne to the Institution grounds. Your Board of Trustees entered into a contract with the Board of Water Works Trustees of the city of Fort Wayne conditioned as follows: That when the territory through which said water main or any part thereof extends shall be taken into the city and the said water main is used by said city, then in that event said city covenants and agrees to refund to the State the actual cost of said water mains or of so much thereof as is taken into the city. The actual cost of the water main from the north limits of the city to the Institution grounds was \$3,858.99. On the first of January of the present year all the territory

through which this water main extended was annexed to the city and the water main became the property of the city of Fort Wayne. Your Board of Trustees at once filed with the city a statement of the account due the State for said water main, and failing to receive payment as stipulated in the contract with the Board of Water Works Trustees of the city of Fort Wayne, the account was placed in the hands of the Attorney-General of the State for collection, where the matter now rests.

With the exception of the Custodial Cottage for Boys, all permanent improvements for which the last General Assembly granted us specific appropriations, have been completed. The appropriation for the Custodial Cottage for Boys was not available until November 1, 1905, and this delayed the construction work until the spring of the present year. However, the building is under roof and inclosed, and we expect to have it completed and ready for occupancy by May 1 of next year.

The Board of Trustees asked of and was granted by the last General Assembly the sum of \$8,000 for improvement to our heating and power plant; the improvement to consist of three one hundred and fifty (150) H. P. high pressure boilers and an addition of twenty-five (25') feet to our old brick stack. It was the plan of the Board to use nothing but high pressure steam for both heating and power purposes, and to arrange the boiler plant so as to connect with the new boilers the one one hundred and twenty-five (125) H. P. high pressure boiler installed in 1891, as well as the new one hundred and twenty-five (125) H. P. high pressure boiler which was installed in 1903. It was found, however, much to our regret, that the old boiler known as Boiler No. 5, which had been installed in 1891, was in such bad condition and so nearly worn out that it could not be placed in the battery of new boilers. This necessitated the rearrangement of our requirements and an additional one hundred and fifty (150) H. P. high pressure boiler. We also found that the addition of twenty-five feet (25') to the old brick stack would not give us sufficient stack capacity for the rearranged plant, and that it would be necessary for us to build a new brick stack seven feet (7') in diameter by one hundred and twenty-five feet (125') high to properly care for our new boiler equipment. The appropriation of \$8,000 was insufficient to meet the additional cost of a new one hundred and fifty (150) H. P. high pressure

boiler and a new brick stack and the Board came to you for relief. You advanced to us out of the Governor's Emergency Contingent Fund for this purpose \$2,892.01, and we are pleased to state that the rearranged plan was followed out and completed.

A complete statement of the regular and specific appropriations made by the last General Assembly and the disbursement of the same for the fiscal year ending October 31, 1906, is as follows:

MAINTENANCE.

Regular appropriation	\$122,000 00	
Excess on 30.108 inmates over 1,000.....	2,910 25	
Expenditures		\$124,909 36
Covered into State Treasury unused.....		89

NEEDS OF THE INSTITUTION.

REGULAR APPROPRIATIONS—MAINTENANCE.

Although most of the supplies chargeable to the Maintenance Fund have materially increased in cost during the past two years, yet we believe, with the strictest economy, we will be able to meet our expenses with a maintenance appropriation of \$122,000 based on 1,000 inmates present, with an additional allowance of \$122 per inmate per annum for all above 1,000 inmates actually present. We find from the experience of the past two years that we can not, with safety, expect to maintain the Institution at a less actual cost than \$122 per inmate per annum, and we would therefore urgently request that the excess allowance remain at this figure.

REPAIRS.

The age of a number of our buildings necessitates constant repairs, and several important roof renewals as well as tile floor repairs are needed at this time to keep our buildings in proper condition. We believe the Repair Fund for the next biennial period should be \$7,500 per annum.

PAINTING.

With the increase of the number of buildings, more inside and outside painting becomes necessary each year. That this may be done promptly as needed, we believe the appropriation for this fund for the next biennial period should be \$2,000 per annum.

SPECIFIC APPROPRIATIONS—FARM LAND.

We find the acreage of Colony Farm wholly inadequate for our needs. Our farming operations are seriously handicapped for want of more land. The acreage now owned by the State does not nearly furnish the provender required to maintain the stock we now have on hand, nor will it furnish employment for the able-bodied boys who will occupy the Colony buildings as soon as the low-grade boys are removed to the Custodial Cottage, now in

process of completion. With the growth of the Institution, we find it necessary to increase our herd so that we can secure the required amount of milk. We need more land for pasture for the herd, and with the addition of 250 acres to the State's present holdings, we would be able to raise all the provender required to maintain the stock. With this additional acreage we can operate the farm much more economically and save the State a large amount now expended for feed that should be raised on our own ground. At this time we are in a position to purchase land adjoining the State's holdings at a reasonable price, which we would not be able to do in the future, as land values near the city of Fort Wayne are rapidly increasing with the growth of the city. The farm of 97 acres immediately adjoining the State's farm on the north, and now under lease by the State, can be purchased for \$10,500, and unless it is purchased at this time, the owner of the land declines to re-lease it to the State, but will sell it to private parties, and thus make it impossible of purchase at this reasonable figure. There is also a parcel of land adjacent to the east and north of the State's holdings containing 160 acres, of which 120 acres are available for farming operations and 40 acres for woodland and pasture, which we believe can be purchased for \$20,000. We urgently request the appropriation of \$30,500 for the purpose of purchasing this additional farm land.

FARM DRAINAGE.

Much of our farm land is in need of drainage. Our maintenance fund is inadequate for this purpose, and we would request an appropriation of \$1,000 to be used for tile drainage.

TILE FLOORS AND IRON STAIRWAY, MAIN BUILDINGS, COLONY FARM.

The present cement floor in the dining-room and scullery of this building is worn and unsightly as well as unsanitary. On account of its constant use, a substantial tile floor should replace the present cement floor. The cement floor in the hall of the south wing, known as "Spangler Wing," is badly worn and unsightly and should be replaced with a substantial tile floor. The stairway in this wing is of wood, cheaply constructed, and should be replaced

with a substantial plain iron stairway. For the purpose of making this improvement to the main building, an appropriation of \$2,700 is requested.

ADDITION TO CUSTODIAL COTTAGE FOR GIRLS.

The present dining-room and kitchen for this building are temporary quarters, small and inadequate for the purpose for which they are used. When this building was originally constructed, it was planned that an addition should be built for a dining-room and kitchen. The present arrangement is very unsatisfactory and inconvenient as well as crowded. The rooms now used as a dining-room and kitchen should be occupied as day rooms, thus increasing the capacity of this building. For the purpose of properly caring for the 150 low-grade girls now housed in this building, a new dining-room 50x40 feet should be constructed, with a dormitory on second floor and a scullery and kitchen, one story, 20x30 feet, in the rear. The wood floor in the center hall of the main building should be replaced with a suitable tile floor. The present wood staircase should be replaced with a plain, substantial iron staircase. We request these latter improvements on account of their constant use and in order to reduce the fire hazard. The porches on the south and west sides of the present building should be enlarged and new floors laid. With the additional dormitory above the dining-room, this building would accommodate 40 more girls, bringing its total capacity up to 190 inmates. For the purpose of making these improvements we would recommend an appropriation of \$21,000.

ADDITIONAL ELECTRICAL APPARATUS.

We find that our present lighting equipment is inadequate. We will not be able to furnish light for the new Custodial Cottage for Boys without additional apparatus. By the installation of multi-phase type generators and motors, we could centralize our power-producing machinery on a most economical basis and discontinue the use of the steam engine in the laundry and the gasoline engine at Colony Farm, now used for pumping water and cutting feed. This new equipment would also furnish power for operating blast fans in the different buildings, in connection with their ventilation,

as well as operating machinery in the industrial building. This equipment can be installed without enlargement of the building now in use. For the purpose of making this change we would ask for an appropriation of \$6,000.

HIGH-PRESSURE PUMP.

The present high-pressure pump has done constant duty for fifteen years and is worn out and a source of great expense to keep in repair. A new high-pressure pump for furnishing water for domestic purposes throughout the buildings should be installed. We would ask for this purpose an appropriation of \$1,200.

FIRE PROTECTION AND EXTENSION OF WATER MAINS ON INSTITUTION GROUNDS.

The new Custodial Cottage for Boys now in process of completion and the Custodial Cottage for Adult Females are both located outside the range of fire protection by our city water mains distributed over the Institution grounds. These water mains should be run over in front of each of the buildings so as to give them full fire protection. Standpipe connections should be made with these mains in both buildings, with hose stations conveniently located on each floor. For the purpose of extending these water mains and equipping standpipes, we respectfully ask for an appropriation of \$4,000.

CEMENT WALKS AND FLOORS.

Cement walks are needed in front of the main Institution building running from the school building to the Custodial Cottage for Boys, also from front entrance of main building to front gate on Griswold avenue, and from the hospital to Custodial Cottage for Adult Females, and thence to the Custodial Cottage for Girls, thence to the rear center of main building and in front of the Industrial building. The basement of the Custodial Cottage for Adult Females and the Custodial Cottage for Girls should have cement floors. For the purpose of making these improvements we would respectfully ask for an appropriation of \$5,000.

PLASTERING CUSTODIAL COTTAGE FOR BOYS.

The original plans and specifications for this building did not contemplate the plastering of the walls, but since the building has been constructed, we have found the brick walls too rough and uneven for a painted surface. The appropriation made by the last General Assembly is not sufficient to take care of the additional cost of plastering this building, and we would therefore request an appropriation for this purpose of \$4,300.

A recapitulation of the above mentioned specific appropriations, with the estimated cost of same, is as follows:

Farm land	\$30,500
Farm drainage	1,000
Tile floors, main building, Colony Farm.....	2,700
Addition to Custodial Cottage for Girls.....	21,000
Electrical equipment	6,000
High-pressure pump	1,200
Extension of water mains on Institution grounds.....	4,000
Cement walks and floors.....	5,000
Plastering Custodial Cottage for Boys.....	4,300

Total	\$75,700
-------------	----------

In closing this report we wish to heartily commend the untiring efforts of the Superintendent, and to acknowledge and thank you for the encouragement, advice and help you have so generously given us in our desire to make this Institution of the greatest benefit to the State and to the afflicted ones who come under its care.

Respectfully submitted,

JAMES W. SALE,
EDWARD M. WILSON,
MARY R. HARPER,

Trustees.

FORT WAYNE, INDIANA. October 31, 1906.

REPORT OF SUPERINTENDENT.

To the Board of Trustees:

I have the honor to submit herewith the twenty-eighth annual report of the Indiana School for Feeble-Minded Youth for the fiscal year ending October 31, 1906:

MOVEMENT OF POPULATION.

	Male.	Female.	Total.
Present, beginning of period included in report	471	565	1,036
Absent on leave, beginning of period included in report	3		3
Total enrolled	474	565	1,039
Present ending of.....	457	566	1,023
Absent on leave	8	4	12
Total enrolled	465	570	1,035
Admitted during period included in report (not including those returned from furlough)....	23	19	42
Discharged	1	1	2
Withdrawn	20	6	26
Died	11	7	18
Daily average actually present.....	455.402	561.967	1,017.369

	Boys.	Girls.	Adults.	Total.
Applications presented	38	32	20	90
Applications accepted pending room.....	24	23	13	60
Applications deferred	6	2	3	11
Applications rejected	8	7	4	19
Applications completed not acted upon.....	2	3	1	6
Total applications on file accepted pending room	24	26	10	60
Inmates discharged	1	1	..	2
Inmates withdrawn	20	6	..	26

Of 90 applications presented to you for consideration, 60 were accepted pending room. Action was deferred on 11, and 19 were rejected. Completed applications on file to be presented at the next regular meeting of your Board are boys, 2; girls, 3; adult females, 1; total, 6. Total applications on file accepted pending room for boys, 24; girls, 26; adult females, 10; total, 60. One boy was discharged as not mentally deficient and one girl was dis-

charged as insane. The children withdrawn were taken out by their parents or legal guardians. Some of them were persons over whom the State should have had the right of permanent supervision, but with our present laws the parent or person placing a child in the Institution can withdraw such child without formality of law and regardless of its condition. The statutes concerning admission of children under sixteen years of age should be changed from the old form of admission on voluntary application of the legal guardian to a commitment by the Circuit Court of the county where such child resides, so that when the pupil is received into the Institution the Board of Trustees become legal guardian with authority to pass upon all requests for withdrawal. The statutes should also be changed to define more clearly the class and type of defectives that shall be cared for by this Institution. The law now says (Sec. 3, Act of 1887): "The purpose of this Institution shall be to care for, support, train and instruct feeble-minded children, the term feeble-minded to include idiotic, epileptic and paralytic children." The two classes last mentioned should be stricken out, as a paralytic uncomplicated ought never be consigned to an institution for mental defectives, and with the new Village for Epileptics recently established there is no sound reason why this Institution should attempt to care for a class when facilities far beyond our reach have been arranged elsewhere.

With the large number of applications for girls that are now on file and others that will be presented within the next two years, it would be unwise to put off longer the arranging of quarters for at least a part of these. The solving of the question of the future of this class of defectives must of necessity be worked out in the State's institutions, and the accomplishment of this task depends very largely upon the age of the individual at the time State supervision begins. It is necessary, therefore, that we build generously, in order that worthy cases may be accepted promptly and before there has been an opportunity to assist in increasing our already too large a population of defectives.

I would recommend for your consideration the construction of an addition to the building known as the Custodial Cottage for Girls. While this building has been in use several years, it was never fully completed, the dining-room and kitchen occupying

temporary quarters. By adding a dining-room and kitchen to the present buildings, using the floor above the dining-room as a dormitory and remodeling the present dining-room and kitchen so that they will be suitable for day rooms, we could accommodate forty additional girls. While this improvement is being made, it would be well to make some changes in the present building by enlarging the verandas on the south and west sides and finishing them with tile floors. With the completion of the Custodial Cottage for Boys, all applications for males that have been accepted pending room, can be received and new applicants can be cared for without delay. In order that you may have a more correct idea concerning our present condition as regards the caring of inmates, I give below the distribution of population, together with the number of beds in each department.

DISTRIBUTION OF POPULATION.

	Enrolled.	Beds.
Main building—Girls	287	287
Main building—Boys	269	261
Cottage for Custodial Girls.....	150	156
Cottage for Adult Females.....	133	123
Cottage, Colony Farm Boys.....	179	185
Nursery Department Hospital—Boys.....	17	16
Total	1,035	1,028

THE SCHOOL DEPARTMENT.

This is the "trying out" field, and every child taken into our Home whose mental and physical condition will permit is privileged to the school test that is to determine his place and position in the Institution. He is given the benefit of every doubt. It is a slow process, in some instances covering a period of several years, but the teacher, realizing the sacredness of the duties devolving upon her, will not relinquish her hope in the child until every resource at her command has been exhausted. We have enrolled in our school department at this time 401 children; all available space is being utilized. Rooms have been fitted up in the basement of the schoolhouse for the sloyd and clay modeling classes, and one room in the Girls' Department (west wing) is being used for school purposes. The remodeling of the present building or the erection of a new schoolhouse must be considered in the near

future. Our present facilities are inadequate, and with the incoming of additional pupils that will follow the opening of our building now nearing completion, the problem of properly caring for this increased number will be one for serious consideration. The progress made in the schools since the adoption of a practical educational plan has been truly marvelous. The change has not been in the work of the child alone but in the child itself. His conduct in the day room, shops and on the playgrounds tells of a school system that is influencing for good in the building of character and establishment of a due respect for the rights of others. The corps of teachers, with three exceptions, remains the same as reported last year. Mrs. Fannie B. Pace, who had charge of the fancy needlework class for several years, resigned to become principal of the school at the Missouri Colony for Epileptic and Feeble-Minded Children. Misses Voris and Lipinski resigned to take up work in the public schools. The vacancies have been filled by competent teachers, who have entered upon their duties with a determination to maintain the high standard already attained by their respective departments. Prof. Cyrus D. Mead was reappointed as principal on July 1st. His work has been characterized by efficient and unselfish devotion to duty that is most commendable. The arrangement of classes and the outline of study for the coming year will be found in the report of the principal, to which your attention is respectfully directed.

MEDICAL DEPARTMENT.

While the mortality rate has been exceptionally low, the department has had the usual number of minor ailments with which to contend. We have been free from epidemics of a serious nature; three cases of typhoid fever have been reported; the source of infection is unknown. Samples of water from the Colony Farm and the main Institution grounds were sent to the State Laboratory of Hygiene for chemical analysis. The report received from the department shows our water supply to be pure and not responsible for the trouble. The number of deaths for the year was boys, 12; girls, 6; total, 18, or 1.86 per cent. The number of hospital cases cared for was boys, 595; girls, 585; total, 1,180. The total number of dispensary cases was 10,400. The improvements begun in

the department last year in the installation of the new steam heating system and a complete remodeling of the ventilation throughout the building, which has just been finished, together with the placing of new fixtures in the operating room and girls' lavatory, have added greatly to the comfort, convenience and cleanliness of the building. The hospital department was in charge of B. Van Sweringen, M. D., a member of our regular consulting staff, from November 1st to December 1st, at which time Dr. Charles G. Beall, the newly appointed Resident Physician, arrived and assumed charge of the department. Dr. Chester E. Hull, of the class of 1906, Indiana Medical College, was appointed as interne to serve one year. Dr. Howard R. Raper, of the class of 1906, Indiana Dental College, was appointed as dental interne. Reference to the work of the dental interne will be found in the physician's report. The members of our consulting staff remain as reported last year. Their suggestions and assistance in carrying on the medical work of the Institution have been invaluable.

The management of the hospital under Dr. Beall has been most satisfactory. While he has been handicapped by lack of proper accommodations for the caring for certain diseases, he has carried on the work in a most efficient manner. Your attention is respectfully directed to the Resident Physician's report appended hereto.

INDUSTRIES.

There have been no additions to our industries the past year. They remain as follows: Shoemaking, tailoring, mattressmaking, broom-making, woodworking, carpentering, painting, brickmaking, sewing, mending and comfort-making, bakery, laundry, gardening, farming and dairy. All of the brick used in the construction of the new Custodial Cottage for Boys was made on our own yard by the boys, with the usual number of paid employees. There was used in this building more than a million brick, the actual cost outlay to the State being \$1.98 per thousand. Detailed report of the work done by the different departments will be found elsewhere.

COLONY FARM.

This has been a fairly successful season. While some of the crops, principally clover and wheat, were short, there was an average yield from most of our fields. While in the raising of stock

we have been more fortunate than usual, the increase in every department has been substantial, as will be seen by the stock report taken from our annual inventory. The productiveness of our farm could be greatly increased by the proper distribution of drain tile. The natural drainage is very poor and artificial drainage has only been put in a few of the fields. This does not call for a large expenditure of money, yet it can not be done out of our Maintenance Fund.

I desire to call your attention to the necessity of having more land with which to carry on the farming operations of the Institution. With the amount of land we now hold it is not possible to raise sufficient provender with which to feed our stock. With the increase in our dairy herd and swine we should add to our present holdings not less than 250 acres of good farming and woodland. This should be contiguous to our present farm, in order that it may be under the supervision of one farm manager. Another reason for the purchase of more land is to furnish employment for a larger number of our able-bodied inmates. About one-third of the population at Colony Building belong to the lower custodial grade and will be removed from Colony to the new Custodial Cottage for Boys next spring. These boys do not assist in the work of the farm, but their places will be taken by the higher grade able-bodied boys, whose labor will be valuable to the Institution as well as themselves, if they are furnished active and healthful employment.

Colts, weanlings	3

RELIGIOUS EXERCISES.

The usual chapel services are held each Sabbath in the main auditorium, as well as in the different detached cottages. All special days are observed with appropriate services.

RECREATION AND AMUSEMENTS.

This is a part of our work that is never neglected. We are continually striving for new features that will amuse and inspire in the child a desire to enter into the sport or play of his associates. During the winter months, evening entertainments, dances and birthday parties are given. These inside amusements continue until the pleasanter spring days appear or until recreations and pastimes are planned outside the buildings. All of our brighter and middle-grade children, both boys and girls, were given an outing at the camp during the summer.

Our Boys' Band and Girls' Orchestra are under the direction of competent leaders, and have made marked progress the past year. The Girls' Orchestra furnished a part of the musical program at the meeting of the State Conference of Charities and Correction held at Muncie.

MAINTENANCE.

It is becoming more and more difficult to keep inside our exceedingly low maintenance appropriation. Supplies of all kinds and the cost of help have increased in value from year to year, while our maintenance appropriation has been based upon a sliding scale, decreasing our income.

I would suggest that we be given a maintenance appropriation of \$122,000 per annum, based upon an actual attendance of 1,000 inmates, with an excess allowance of \$122 per capita per annum for each inmate over that number. Our excess maintenance for the past year amounted to \$2,910.25, making the total maintenance available, \$124,910.25. Our expenditures for all purposes except repairs and improvements was \$124,909.36, making the net per capita cost for the year, \$122.77.

REPAIRS.

It has not been possible to make all repairs needed because of an insufficient repair fund. The more urgent needs have been cared for, but many things we were compelled to postpone.

I would again ask for an increase in this fund, that repairs may be made promptly when occasion demands.

SPECIFIC APPROPRIATIONS.

The new kitchen and dining-room building at Colony Farm has been completed and in use about eight months. All the wooden structures in the rear of the main building have been removed, the grounds graded and cement walks put down. With a few changes in the main building our property at the Colony will be in excellent condition. The buildings have been equipped with a 500-gallon stationary chemical fire engine of the American La France type, with eight stations so distributed over the building that every department is amply protected. A watchman's clock system has been installed and connected with our register at the main Institution. The changes in the heating and ventilating at the hospital have been finished; the addition to the laundry building and installation of new equipment gives us ample facilities for our present needs. Our boiler house and power plant has had a complete overhauling. The old low-pressure boilers have been replaced by four 150 H. P. high-pressure boilers. One of the old 125 H. P. boilers was reset and is being used to heat water for house purposes. A 500 H. P. open feed-water heater has been installed for boiler purposes, and a radial hollow brick chimney seven feet in diameter by 125 feet high takes the place of the small chimney, which was found of insufficient area to give proper draft for the new boiler equipment.

The new Custodial Cottage for Boys is nearing completion and when finished will compare favorably in construction and plan with the best buildings on the grounds. The appropriation for painting has been exhausted. A fund for that purpose should be a part of our regular appropriation in order that all buildings may be kept clean and in a sanitary and healthful condition.

OUR NEEDS.

Our farming operations are handicapped for want of sufficient land to carry on the work economically. The acreage now owned by the State does not furnish enough provender to maintain the stock we have on hand, nor furnish employment for the available able-bodied boys that we desire to place at the Colony. We should have not less than 250 acres in addition to our present holdings. The farm land is in need of a thorough system of drainage. This should be done early next spring.

The floors in the dining-room and some of the halls on the first floor of the Colony building need replacing. I would recommend the use of tile to take the place of cement and wood.

For the purpose of increasing our capacity in caring for girls and completing the building known as the Custodial Cottage for Girls, a dining-room and kitchen should be added to the present building, the second floor above the dining-room to be used as a dormitory, the rooms now being used as temporary dining-room and kitchen to be remodeled and used as day rooms. This would give additional room for forty girls. The porches on the south and west sides of old building should be enlarged and tile floors put in.

The main auditorium (or chapel) is not large enough to furnish seating room for all children who could attend. A gallery placed across the rear of the room would give ample accommodations. Cement walks are needed between the different buildings and from the front entrance of the Administration building to the street. Also cement floors in the Custodial Cottage for Girls and Cottage for Adult Females. We will not be able to furnish light for our new Cottage for Boys with the present equipment. By the installation of multiphase type generators and motors, the steam engine used in the laundry and gasoline engine used at Colony Farm for pumping water and running feed cutters could be done away with and our power-producing machinery centralized. Motors are now used for operating machinery in the Industrial building and blast fans in the Custodial Cottage for Girls. The new equipment would take care of all these, besides light for all the buildings and grounds. A new high-pressure pump for furnishing water throughout the buildings should be installed, this to replace a

pump that has done constant duty since the establishment of the Institution. The additional machinery can be installed without any alteration or enlargement of the building now in use.

The usual appropriation for painting should be continued. That there may be no delay in making repairs to our buildings, I would respectfully ask that the Repair Fund be increased to \$7,500 per annum. All brick required for the improvements requested will be furnished from our own yards.

CHANGES IN ADMINISTRATION.

Miss Jennie Battershall, who was connected with the Institution for eighteen years and serving as Matron the past three years, resigned on September 15, 1906, to take a much-needed rest. She was conscientious, loyal and indefatigable in the discharge of the many and arduous duties that devolved upon her. She gave the best years of her life to the work of the Institution, always cheerful, never complaining, ever striving to smooth the path or make more joyous the lives of those she had labored for so long. Miss Nora Griffin was appointed Acting Matron, to serve until a permanent appointment is made.

Mr. William H. Scheiman, who filled the position of clerk for two years, resigned on August 17, 1906. Mr. John A. Ross, of Indianapolis, was appointed to fill the vacancy.

LOSS BY FIRE.

Our horse barn on the main Institution grounds was partially destroyed on November 15, 1905. Fire was discovered by the watchman while making his midnight inspection of detached buildings. The alarm was sounded and the Institution Fire Brigade responded promptly, but the flames were soon beyond our control. The timely arrival of the Fort Wayne City Fire Department, under Fire Chief Henry Hilbrecht, saved us from having a serious loss. The fire was confined to the upper part of the building, the contents of the mow and roof being totally destroyed. The damage to the building and contents as adjusted by the insurance companies was \$1,665.83, which amount was collected and turned into the general fund of the State. The building was repaired without delay at a cost of \$991.17 from our General Repair Fund.

SPECIAL MENTION.

On December 3, 1905, we were honored by a visit from members of the British Royal Commission on the care and control of the feeble-minded, the commission being represented by William Patrick Byrne, Esq., C. B., Willoughby Hyett Dickinson, Esq., Mrs. Ellen Francis Pinsent, Horatio Bryan Donkin, Esq., M. D., and James Crawford Dunlap, Esq., M. D. The purpose of the commission's visit to America was to study existing methods in caring for feeble-minded, epileptic and other defective classes.

IN CONCLUSION.

I desire to thus publicly express my appreciation for the loyal and efficient support of my co-workers in every department. They have never failed me, and to them belongs the credit for whatever of success has been achieved. I heartily commend them to you as worthy of serving a great State in one of her noblest undertakings.

And to you I feel doubly grateful. Your advice and counsel has been most helpful and the deep interest manifested by each member of the Board in every phase of the work has been an incentive to greater and better things.

Respectfully submitted,

ALBERT E. CARROLL,
Superintendent.

REPORT OF SCHOOL PRINCIPAL.

To the Superintendent:

The School Department respectfully submits its annual report for the year ending October 31, 1906. It creates a pardonable pride to see the teacher's enthusiasm swell at the way her pupils "retain" from last year. The credit is hers; it simply bespeaks a thoroughness in her method that obtained to a high degree last winter. Nothing has been sacrificed, no one has been pushed aside, school has "kept" continually and the children have enjoyed themselves to the fullest extent. Our enrollment consists of 401.

GENERAL SCHOOL WORK.

Our schools afford the mentally deficient child of the State the same training and advantages open to the children of the public schools. In fact, we might say more, for in addition to the school of letters and manual instruction; in addition to special gymnastic exercises, voice and piano training, band, and orchestra lessons, at least twelve different kinds of industrial work are taught in the shops of the Institution at large. In school the same text is used, the same teacher is employed, and the same system and routine is followed. The difference is one of degree more than kind. It is more intensive, less extensive. Instead of the "head and heart and hand," it is the "hand and heart and head" order. It is not to be inferred, however, that primary and intermediate courses are third in importance and results.

The schools change at the noon hour, allowing for each a half day at work and a half day at school. The slower children come in the forenoon, the brighter in the afternoon. The morning school continues to progress, considering of course the difference in the child, at a more noticeable rate than the afternoon. The teacher prides herself as much with these slower ones as with her brighter classes. They share along with the afternoon pupils some of the new material and many of the new ideas. The special day is theirs the same as for the others.

The afternoon boys and girls will accomplish nearly as much as the public school grade children, but in a somewhat longer time. It is our aim at all times to keep in touch with the newer educational ideas as they appear, so that our children may enjoy exactly the same advantages as those of the public schools. New material and apparatus is being added each year. We hope this winter to place new maps and globes in all the upper rooms. The new book in English and the new physiology (both Indiana series) have supplanted the old ones.

THE KINDERGARTEN.

The mission of the kindergarten is fulfilled in our particular kind of school if it were never in vogue elsewhere. Action to a mind slow to perceive; construction to a hand enfeebled; an appeal to the fancy and imagination of a child of arrested growth, is sounder doctrine in pedagogy than is the same applied to the normal condition. Our children act the squirrel, the bird, the worm and butterfly, the shoemaker, and the blacksmith; they cut and form, sew and color the tree, the fruit, the birdhouse; they listen to the tale of the "three bears," "the gingerbread man," and "Roly-Poly," around the kindergarten circle. There would be no seat for him or her outside, but here they enjoy all the privileges and pleasures allotted to the normal child. Our kindergarten (exclusive) is now all with one teacher, in one room, and is truly a kindergarten.

THE GRADE.

But the larger world presents itself. The time arrives when the childish things must be laid aside, and that at not too old an age. The kindergartner enters the grade and forms his letters, sounds his letters, reads and writes them. Here, and with number work, his action play is drawn upon again. His walk-run-hop words are actually walked, run, and hopped. His ball-apple-top words are felt, thrown, and placed. His 1-2-3 and 4 are not at first in chalk and pencil, but grains of corn, cubes of cardboard, colored pegs, objects about the room, or imitation sweets.

He is not "instructed" in nature, he is shown it. He should never "think" it, but he should be led to "feel" it. Some excellent results followed last year. A deeply seated lesson crept

through the whole Institution life last spring by the placing and guarding of bird boxes drawn and constructed by the boys. It created respect and sympathy and love for the life of the bird and animal, and even the flower. Before this, he would tear down the nest; now he shields it. Two years ago he fought the bird; now he will fight for him.

The boys are carried to the fourth and fifth grade, the girls to the sixth and seventh. History, geography, composition, and physiology enter at their proper places.

MANUAL AND ART.

Thus far it has been mostly the "head and heart"; the hand now applies itself. It is still activity, but in a more tangible form. A realization of the power to "do," a hope enkindled by a creation in clay or wood, linen or water color, growing before the eye, awakens a pride, and a tangible result here stimulates him to further effort at his books. It cultivates neatness, insists on accuracy, demands application, develops originality, and affords a pleasure. One hundred and fifty-two pupils receive some form of manual or art work. To some this is given as a reward, but to the majority as regular school work.

In wood, a mechanical drawing precedes the object constructed. Several boys are promoted to the bench where larger and more practical things will be made with a view of supplying the schoolrooms. In clay, the girls work from the natural forms of flowers, foliage, vegetables, fruit, and animals, when obtainable, otherwise from casts. More advanced pupils model from casts the more difficult objects, as medallions, heads and busts, while some figure poses from life are done. In the primary class the holidays and seasons are observed by illustrating in clay the story of Hiawatha, the Puritans' Thanksgiving, Santa Claus, the Eskimos, etc. Casts will be used for decorating our rooms.

In art studies, nature predominates in the washes and pencils of the earliest blossoms of spring, to the seedpod and glowing colors of autumn. Outdoor sketching brings the seasons in all their beauty to the classes. It makes the study of the bird, flower and insect in the room more intelligent. Oil as a medium will be used this coming winter. Oriental art and textures will be

studied. Simple pieces in water color will be passed through the rooms to be placed on the walls.

In fancy needlework, our usual drawn, eyelet, embroidery, Hardanger, raffia, and lace work will be continued. In addition, we will have designs in rug weaving, hanging baskets, and flower-pot covers in reed suitable for schoolroom use. This coming winter will let us hemstitch and monogram much practical and useful linen for the Institution. In embroideries, cut work, Hedebo, Biedermaier, Montmellick, cross-stitch, and shadow work will be introduced.

MUSIC AND PHYSICAL.

The "better self" is not overlooked. There is a "soul" training. The leaven that permeates the furthest Institution corner is the music, voice, piano, orchestra, and band. The greater part of five hundred help in general singing. From eighty to one hundred are given special instruction in male quartets, four part mixed choruses, girls' part singing, etc. The number at piano is more than ever before. A yearly recital is given in voice and piano. The girls' orchestra of twelve pieces leads in Sunday Chapel and is heard at the different cottages during the year. The boys' band brightens our Sunday mornings by music on the lawns. The Institution feels a pride in both of them.

In all our work above, one must not presume the normal body. A physical deficiency generally accompanies a mental inertness. From the time he enters to the time he leaves school a certain period daily is devoted to systematic physical work. Courage and confidence, traits lacking, are instilled. Better muscular control should mean a better step and a straighter line, and what is not improbable, better writing in school. An idea of the care of the body will supplement the work. The classes are larger than ever before. We are badly in need of an extension of the schoolhouse to allow a well-equipped gymnasium, as well as to meet the crowded condition of the schoolrooms.

EXHIBIT WORK.

Our Chapel in June was never prettier with display work, including articles from each of the industrial departments. The better part was taken to the State Fair exhibit at Indianapolis

and displayed along with school and industrial work from each of the State institutions and public school. Many thousand people handled the various articles made in our shops and industries. The kindergarten house, which was furnished by the children, was a center of attraction to old as well as young. Manuscripts of the primary and upper grades and the mounted grains, leaves, flowers, and nature papers passed as public school work. The fancy linen, lace, and Hardanger received many compliments, as did the casts in clay and constructions in wood. The studies of features, landscapes, and of our fruits and vegetables, flowers, and common birds, would hardly be accepted as coming from our schools. It offered the people of the State a splendid opportunity of seeing what was being done.

THE COMING YEAR.

The study of bird life was so successful and of such value last spring that it will lead in our nature work this coming year. Our pupils are looking forward to having some of their material chosen by the State Superintendent for the next Bird and Arbor Day Annual. Our aquariums are restocked, our rooms filled with flowers and nature, the schoolhouse is cleaner than many of the best. The nature collections will continue, the school garden also. We will attempt in the upper grades, an accurate record of the daily length of the sun's shadow, and some experimental work in physiology. For the first time, each teacher has her room both with morning and afternoon schools. We feel perfectly confident of making the coming year the best in our history.

The kindergarten begins with a number of new children. Many have never known a mother's love. The home will be carried to them. A complete set of dishes and glass they will have for their own. Monthly lunches will be served from white linen. They must learn "manners" along with their "colors."

In primary and grade, the phonic method in reading has been especially successful. It will be extended. Silent reading for better expression will make better readers. A booklet showing the writing of each child monthly, together with one which records his deportment, will be kept at the school office. The upper girls will read "Midsummer Night's Dream" and dramatize it. The story

of Hiawatha will be seen Thanksgiving as conceived by kindergarten, grade, clay modeling, and art classes.

Pottery will be made by the more advanced modeling girls. The Institution in miniature will be set in clay. Perspective drawings of the grounds and buildings, together with the story in water color of the trees in their seasons, have been considered. The bench boys will attempt music and book racks in oak.

The winter has many good things in store for the children. The circuses have passed, camp has closed, but nutting is in season, dances and birthday parties are near at hand, bi-weekly entertainments have begun, Arbor and Bird Day was celebrated, Harvest Home, Halloween, Thanksgiving, Christmas, Washington's birthday, Easter, Decoration Day, and the "Fourth" are on the Institution calendar. An overhauling of our children's library should not be far off, also a reading-room for the various buildings. An employes' library should be encouraged. A small printing press with which to issue our weekly bulletins would be of great value.

A regularity in attendance, a liberality in material, a sympathy and co-operation from the supervisor of boys and supervisors of girls starts the year encouragingly. The teachers are enthusiastic, and filled with new ideas. They have rubbed up against their fellows and imbibed of other sources. Their calling is strenuous. Their work is a noble one. They have all they can do. They give their best to the demands of a great profession. Your confidence and esteem is highly prized. They will strive to merit it and repay you for your encouragements by the best school year.

Respectfully submitted,

CYRUS D. MEAD,

Principal.

REPORT OF RESIDENT PHYSICIAN.

Mr. A. E. Carroll, Superintendent:

The following is the report of the Medical Department for the fiscal year ending October 31, 1906:

The general health has been good. We have had two epidemics of minor importance, one of chicken-pox and one of whooping-cough. We are sorry to have to report three cases of typhoid fever, two from Colony Farm and one at the main building. Samples of water from both places were sent to the State Laboratory of Hygiene, and the report stated the water was good and in all probability not responsible for the cases of typhoid fever. Two papers of scientific interest have emanated from the department during the year, one on "Some Experience with Tuberculin," published in the Fort Wayne Journal Magazine, November, 1906. The other on "Heredity as a Cause of Dental Anomalies" (first prize essay), published in the "Dental Brief," October, 1906.

The admittances to the Hospital have been 585 girls and 595 boys. The dispensary cases numbered 10,400. Eight autopsies have been held during the year. The death rate for the year has been 1.86 per cent.

The medical library is being gradually increased by the addition of one volume a month. The regular repairs of the Hospital have been kept up and new plumbing in both ward bathrooms and in the operating-room has been installed. The members of our consulting staff have been of much service during the year, and we wish to express our thanks for their assistance and advice.

Below is appended a list of the more important medical and surgical cases and the mortality record.

Dr. Chester E. Hull, of the class 1906, Indiana Medical College, was appointed as interne to serve one year. He has been of much assistance in the general medical work of the Institution.

Dr. Howard R. Raper, of the class of 1906, Indiana Dental College, was appointed dental interne. The following is the work done by him while here:

Mouths examined	1,059
Mouths cleaned	792
Secondary teeth extracted.....	211
Primary teeth extracted.....	64
Roots extracted	113
Gold fillings inserted.....	10
Gutta percha fillings inserted.....	2
Cement fillings inserted.....	97
Amalgam fillings inserted.....	289
Compound cement amalgam fillings inserted.....	13
Compound gutta-percha amalgam fillings.....	13
Root canal fillings.....	12
Models of mouths made.....	51
Cases of regulation.....	1
Partial artificial, vulcanite denture.....	1

The necessity of a new hospital is becoming more manifest each year. The building which we now occupy can not with advantage have any additions made to it, while as it now stands it could be used very nicely for a cottage for inmates. The Hospital is crowded almost continually and we have no room whatever on the girls' side for isolation cases, the one room which we have being used for active tuberculus cases, and they must spend the greater part of their time with the nontuberculus. Again, the sick high-grade child must often be placed next to the sick lower-grade child, and this, to say the least, is not at all pleasant. We should also have a receiving ward in which the new inmates may be placed until the complete physical and mental examination is made, so they can be assigned to their proper divisions, and at the same time stop the spread of any contagious disease should it appear.

In conclusion, I wish to express my thanks and appreciation of the work done by the nurses and other hospital employes, as it is only by their co-operation that we have been able to accomplish what we have.

Respectfully submitted,

CHAS. G. BEALL,
Resident Physician.

REV. THOMPSON ASHBURN.

REPORT OF BOARD OF TRUSTEES.

To the HON. J. FRANK HANLY, Governor of Indiana:

Sir—As required by statutory provision, the Trustees of the Southern Indiana Hospital for the Insane submit herewith the ninth biennial report, covering the period ending October 31, 1906.

In January, 1905, the entire membership of the Board having been vacated by expiration of term of one member, by resignation of one member and by removal from office of one member, Governor Durbin appointed

John S. Bays, of Sullivan, to serve for three years,
Samuel H. Wulfmann, of Huntingburgh, to serve two years,
John T. Stout, of Paoli, to serve one year.

The Board was organized with

John T. Stout, President,
John S. Bays, Vice-President,
Samuel H. Wulfmann, Treasurer.

In January, 1906, Mr. Stout having been re-appointed for a full term by your Excellency, the organization was continued as before.

In August, 1906, Hon. John S. Bays having died, you appointed his son, Fred F. Bays, to fill the vacancy, and he was elected Vice-President of the Board.

SPECIFIC APPROPRIATIONS.

The appropriations for specific purposes have been expended as anticipated, excepting the sum of \$200 for repairs of smoke-stack, which sum was not asked for, and was altogether insufficient for the purpose designed.

The new tank and softener installed have greatly increased the efficiency of the water system, and afford greatly increased protection against fire.

The warehouse addition to store and quarters for fire apparatus are well built and thoroughly adapted for the purpose.

The new bakery building is ample in proportion, well arranged, and equipped with a magnificent oven.

The repairs to heating system have proven highly satisfactory, and have augmented the comfort of the inmates.

The statement appended hereto shows the condition of the various funds during the period, and the financial exhibit included in the report of the superintendent gives in detail their expenditure:

1904-1905.

GENERAL CONDITION OF THE INSTITUTION.

During the past two years the general condition of the institution has been greatly improved by the addition of several needed reforms in the operating departments. There has been a decided policy of upbuilding manifested by the superintendent, which has wonderfully improved and benefited the institution, all of which are enumerated in detail in the report submitted by Dr. Laughlin.

ATTENTION TO PATIENTS.

The patients have received the closest attention from the medical staff, and everything reasonable has been done for their comfort. They have been properly clothed, and their food is of excellent quality and sufficient quantity.

Much has been done to relieve the monotony of their confinement. At frequent intervals evenings are set apart for their entertainment. These entertainments consist of parties at which various games are played, dances, dramatic performances and "smokers" for the men. The amount of pleasure derived from these entertainments by the patients can not be estimated.

The holidays are always observed in grand and appropriate style. All of these entertainments are participated in by a large per cent. of the patients.

The quarters of the patients are kept in an excellent condition, at all times being clean, odorless and of proper temperature.

CONCLUSION.

In conclusion, the Board is more than pleased to be able to say that there has existed at all times a perfect harmony among the members of the Board, and that they have found it a great pleasure to work together for the good of the institution in the discharge of the important duties assigned to them.

It is also most pleasing to report that there is a harmonious condition existing throughout the institution, and that the advancement of the institution in general is substantial and well defined.

The funds have been applied with conscientious regard for economy and the purpose for which they were intended. The motto of this Board is to set, at every meeting, a higher mark for advancement. The Board is cognizant of the high character of duties resting upon them, and the members of the Board are striving with a united effort to place this Hospital in the most perfect condition possible.

Respectfully submitted,

JOHN T. STOUT,

FRED F. BAYS,

S. H. WULFMANN,

Board of Trustees.

Evansville, Ind., December 11, 1906.

REPORT OF THE MEDICAL SUPERINTENDENT.

To the Board of Trustees:

Herewith is submitted the report of the operation of the Southern Indiana Hospital for the Insane for the biennial period ending October 31, 1906:

MOVEMENT OF PATIENTS

For the Year ending October 31, 1905.

	<i>Men.</i>	<i>Women.</i>	<i>Total.</i>
Enrolled October 31, 1904.....	362	320	682
Admitted during 1904-1905.....	95	79	174
Total treated	457	399	856
Discharged—			
Recovered	21	22	43
Improved	30	23	53
Unimproved	4	3	7
Not insane	1	1	2
Total discharged	56	49	105
Died	44	23	67
Total discharged and died.....	100	72	172
Remaining October 31, 1905.....	357	327	684

Per cent. on total number treated.....			4
Per cent. of deaths on total number treated.....			6.8

MEDICAL HISTORY.

Nothing requiring special comment has occurred during the period, and the medical history is stated in a succinct form in the various statistical tables incorporated with the report.

ADMISSIONS.

The total number admitted since the opening of the Hospital, November 1, 1890, is 2,488—1,332 men and 1,156 women.

The admissions during the first year of this period were 174—95 men and 79 women.

During the second year there were admitted 148—86 men and 62 women.

The highest number enrolled during the period was 698; the lowest, 648. The highest number present was 657; the lowest, 591.

DISCHARGED.

Fifty-six men and 49 women, a total of 105, were discharged during the first year. The condition at the time of discharge was: Recovered, 43; improved, 53; unimproved, 7; not insane, 2. The number discharged recovered and improved represents 55 per cent. of admissions.

During the second year there were discharged 46 men and 32 women; total, 78.

Of those discharged there were recovered 34; improved, 34; unimproved, 9; not insane, 1. Those discharged recovered and improved represent 46 per cent. of admissions.

MORTALITY.

During the first year there were 67 deaths—44 men and 23 women, representing 7.8 per cent. of the total number treated.

During the second year there were 57 deaths—34 men and 23 women, representing 6.8 per cent. of the number under treatment.

The number of deaths during the period from tuberculosis was 21, and represents 18.4 per cent. of the total number of deaths.

During the second year of the period one patient deliberately committed suicide by throwing himself in front of a moving train.

OCCUPATION AND AMUSEMENTS.

The effort is constantly made to supply as many as possible with some congenial employment, and many of the patients are engaged in caring for the buildings and grounds and in cultivating the farm.

The usual forms of amusements are continued, the weekly dances being a great source of pleasure to a very large per cent. of inmates. At frequent intervals groups of patients are taken to the city to attend the theaters and occasionally to the circus.

Local amateur dramatic companies occasionally give an entertainment. The national holidays are observed in elaborate style, and the patients enter into the spirit of the occasion fully.

Social gatherings are held in the amusement hall of evenings, and music, recitations and games are enjoyed, and refreshments are served.

The men occasionally are invited to a "smoker," which they greatly enjoy.

IMPROVEMENTS.

The General Assembly of 1905 made for the purposes indicated the following specific appropriations:

Water tank and softener process.....	\$12,000 00
Bakery and equipment.....	4,000 00
Repairs to heating system.....	3,000 00
Warehouse and fire department.....	2,000 00
Equipment and painting laundry.....	2,000 00
Fire escape	1,000 00
Equipment for machine shop.....	1,000 00
Repairs to smokestack.....	200 00

Tables showing in detail the disposition of these funds are given in the financial exhibit.

WATER SYSTEM.

With the fund for the water system we have made the following improvements:

An iron tank with a capacity of 100,000 gallons has been erected on a steel tower 137 feet high.

A water softener with a capacity for treating 10,000 gallons per hour and a $16 \times 10\frac{1}{4} \times 10$ duplex pump have been installed.

The water is now pumped from the wells directly into the softener, where it is treated chemically to remove the scale-forming salts; it then flows to the old reservoir near the power house, whence it is pumped to the elevated tank or directly into the main as desired.

The water in the tank maintains a constant service pressure of fifty-five pounds.

Since the softener has been in operation we have been enabled to dispense with expensive and unsatisfactory boiler compounds, and have entirely overcome the trouble from scale in the boiler tubes.

The water is much more satisfactory for laundry use and for general purposes also.

The tower and tank was built by the Chicago Bridge and Iron Company.

The water softener was built by the Kennicott Water Softener Company, of Chicago.

The pump was built by the Laidlaw-Dun-Gordon Company, Cincinnati.

BAKERY.

The bakery is a structure 29 feet 6 inches by 66 feet, one story, built of pressed brick with slate roof and cement floor and steel ceiling, twelve feet high. The inside wall, to a height of 6 feet, is built of cream-colored enameled brick, and above that height with pressed brick.

The building is divided into a work-room 28 feet by 51 feet, a supply room 16 feet by 13 feet, and a bread-room 12 feet by 13 feet.

The bakery is equipped with a Bosemer Patent Peel Oven 10 feet by 12 feet. The exposed front and side wall of oven are of enameled brick.

The oven was built by the Joseph Baker & Sons American Oven Company, Chicago.

WAREHOUSE AND FIRE DEPARTMENT.

The warehouse is a one-story and basement extension of the store building. It is 25 feet by 36 feet, built of pressed brick, and has a tin roof.

The fire department building is a one-story structure adjoining the extended store building; is 16 feet by 48 feet in size, and is built of pressed brick, with tin roof.

The Stratman Hardware and Builders' Supply Company, of Huntingburgh, Ind., were the builders of the bakery, warehouse and fire department buildings.

REPAIRS TO HEATING SYSTEM.

The heating system was thoroughly overhauled and remodeled, and was converted into a modification of the Warren-Webster Vacuum System. A comfortable degree of temperature can now be maintained throughout the Hospital, which was formerly impossible during the extremely cold weather.

EQUIPMENT AND PAINTING LAUNDRY.

We have added to the laundry equipment:

- One Kinyoun-Francis sterilizer,
- One dry room,
- One washer,
- One extractor,
- One electric ironing table.

MACHINE SHOP.

There have been added to the equipment of the machine shop:

- One Oster pipe-cutting and thread machine for one to six-inch pipe,
- One 18-inch American lathe,
- One emery grinder.

FIRE ESCAPE.

A Kirker-Bender fire escape was added to the new wing Department for Men.

REPAIRS TO SMOKESTACK.

The appropriation of \$200 for this purpose was insufficient for the purpose intended, and was allowed to revert.

MINOR IMPROVEMENTS AND REPAIRS.

The colonnades connecting the new wings with the old building have been enclosed with wire screens, enabling us to have the patients in adjacent wards in the fresh air during the most inclement weather.

Seven of the wards have been supplied with iron beds since our last report.

In placing new pumping machinery in engine room it was necessary to tear out considerable of the concrete floor, and the entire floor has been laid with vitrified tile.

Four hundred and fifty young maple trees have been planted in the south part of the grounds.

The old carpenter shop has been remodeled and equipped with heat and water, and serves as very comfortable quarters for the outside men employes.

The tin work on roof and valleys has been repaired, and much of it has been renewed.

The general repair work requires much of the time and attention of the artisans, and the original buildings begin to show the effect of age and inferior workmanship.

NEEDS OF THE INSTITUTION.

INCREASED CAPACITY.

We are compelled to delay the admission of many cases because of insufficient room, and it is computed that there are 106 persons in the district now awaiting admission because of this condition.

If it is desired to relieve this condition, it can be done by providing an infirmary for the reception and proper classification of new cases, and for the treatment of those physically sick.

Second, congregate dining-rooms would greatly simplify the problem of food distribution and eliminate the objections to the present method.

By these means the maximum demands of the district would be amply provided for.

LAND AND DAIRY.

Only sixty-five acres of land are available for cultivation, which, with the present population, is entirely inadequate. A larger acreage of land is very desirable, not alone for the economical administration of the Hospital, but also to afford opportunity to provide useful and wholesome occupation to the patients.

Notwithstanding that we are paying an excessive price for milk, we experience difficulty in procuring a supply sufficient for our needs. Two hundred acres of land should be added to the present tract and provided with a well-stocked dairy.

POWER AND HEAT.

If any buildings are added it will require an addition to the steam boiler equipment. Four of the boilers have been in service for a period of sixteen years, and two for a period of seven years. All of them were set low with mud drums concealed, and their real condition is largely a matter of conjecture.

I recommend an entire renewal of the boiler plant by the installation of three boilers of 300 horsepower each, equipped with stokers, and a new smokestack. This change would not require any material change in the building, but would provide increased room for storage of fuel.

SEWERAGE.

You are aware of the complaints that are constantly made of the method of sewage disposal, and the matter is emphasized by the suit now pending against you on that account. It is unfortunate that the recommendation of the State Board of Health was ignored when the present sewage plant was built.

With your approval I have had Dr. J. N. Hurty, Secretary of the State Board of Health, and R. L. Sackett, C. E. and sanitary expert, make a sanitary survey of the plant. They recommend that the present plant be converted into the septic method of sewerage disposal, and Prof. Sackett has submitted an estimate of the cost of proposed change, which he states would be \$13,500.

BAKERY EQUIPMENT.

For this purpose there will be needed an appropriation of \$1,000.

CLOTHING FOR PATIENTS.

In the matter of clothing, 250 patients are rated as home supplied, and 447 patients as county supplied. After the patients have been in the Hospital for some years the relatives, in many instances, relax their interest and become negligent and indifferent about supplying the necessary clothing, and often the delay is very embarrassing. I think it would be highly commendable for the Legislature to make provision whereby the State should supply the clothing for all the patients, as all other needs are now supplied, thus putting all on the same plane and eliminating this source of vexation and complaint.

Appropriations for

1907-1908.		1908-1909.	
Maintenance	\$106,260 00	Maintenance	\$106,260 00
Repairs	6,000 00	Repairs	6,000 00
Clothing	4,500 00	Clothing	4,500 00
Painting	1,000 00	Painting	1,000 00

\$160 per capita per annum for each patient present in excess of 644.

Specific.

Two congregate dining rooms.....	\$50,000 00
Hospital for the sick.....	45,000 00
Boiler equipment	33,500 00
Land and dairy.....	31,000 00
Sewerage plant	13,500 00
Bakery equipment	1,000 00

To you, gentlemen of the Board of Trustees, I am profoundly grateful for your advice, for your loyal and earnest support, and for the encouragement you have given me in the performance of my duty.

Respectfully submitted,

C. E. LAUGHLIN,
Medical Superintendent.

November 20, 1906.

By act of the General Assembly of 1903 the maintenance of this Hospital was placed at \$101,168, with \$160 per capita per annum for each person present over an average of 620. The daily attendance by months was as follows:

1904.

November	616.800
December	608.935

1905.

January	605.322
February	599.285
March	596.612
April	604.900
May	605.096
June	603.702
July	612.000
August	628.000
September	631.300
October	624.064
Total present over an average of 620.....	23.364
Fixed appropriation	\$101,168 00
Sliding appropriation	322 25

Total maintenance available for the year.....\$101,490 25

CAPITOL BUILDING, INDIANA TERRITORY, VINCENNES. ERECTED ABOUT 1806.

This building is still standing and is now being used as a residence. It is in a fair state of preservation. The purchase of

CUSTODIAN'S REPORT.

OFFICE OF CUSTODIAN, STATE HOUSE,
Indianapolis, Ind., November 1, 1906.

To the Honorable J. Frank Hanly, Governor:

Sir—The act of the General Assembly of March 5, 1889, creating the office of Custodian of Public Buildings and Property, requires the Custodian to file a report on the last days of March, June and September of each year, and an annual report on the last day of December of each year, and a report for the two years preceding each session of the General Assembly.

The quarterly and annual reports have been duly submitted; and in further compliance with the law, and in obedience to your letter of instructions, I have the honor to submit herewith, for your examination and the consideration of the General Assembly, the ninth biennial report of this department, comprising an itemized account of the expenditures in detail from the different funds during the period from November 1, 1904, to November 1, 1906, and some recommendations as to the manner in which the service of this department could be made more efficient and economical to the State.

SURVEY OF CAPITOL GROUNDS.

The grounds now occupied by the State House are known as squares 48 and 53, in the city of Indianapolis, and that part of Market and Wabash streets lying between Capitol and Senate avenues (formerly Tennessee and Mississippi streets); also, that part of Huron street, or alley, lying between Ohio and Market streets, in the city of Indianapolis. These parts of streets were declared vacated by an act of Common Council and Board of Aldermen on the 22d and 23d days of April, 1878. Square 53, the site of the old State House, was reserved from sale by the State when the city was laid out. Title to the north half of square 48 was acquired by purchase from W. P. and E. P. Gallup, and by grant from the

city of Indianapolis; the south half of the same square had also been reserved from sale by the State. The tract above described, and known as the Capitol grounds, is 930 feet in length and 420 feet in width, and contains an area of about nine (9) acres, in the center of which is located the present State House, 496 feet long and 283 feet wide.

CEMENT WALKS.

There is urgent need of repairs to the steps and concrete work of the approach to the west entrance of the building, and for this improvement I would recommend an appropriation of five hundred dollars (\$500.00).

Pedestrians going east and west on Market street are confronted with either climbing the steps to the two respective entrances or going around the building, neither of which the public seems disposed to do, and many of them take the nearest way, which means that trespassing on the grass is the result, thereby making beaten paths which mars the beauty of the lawn. To prevent this condition and as a convenience to the general public, I recommend the building of good concrete walks from the four corners of the building to the streets (Capitol and Senate avenues), and for this improvement I would recommend that the sum of five hundred and fifty dollars (\$550.00) be appropriated.

The sidewalk running parallel with Washington street, extending from Capitol avenue to Senate avenue, and abutting the south line of the Capitol grounds, is in bad repair and very unsightly, and can only be improved by rebuilding. I therefore recommend the appropriation of fifteen hundred dollars (\$1,500.00) for the construction of a new walk.

NORTH ENTRANCE DRIVEWAY.

There is but one wagon-way to this building, and this unimproved, over which is delivered all of the drinking water, furniture and carpets, books and stationery, express parcels, 1,200 tons of coal annually, all the Quartermaster's supplies, which includes equipment for 4,000 men, said equipment being hauled in and out once a year, and all other freight and traffic to and from the building passes over this unimproved roadway, causing a mudhole in wet weather and a condition not in harmony with the premises at

any time. This driveway should be paved, and for this improvement I recommend the same be done either with brick or granolithic concrete, and an appropriation of seventeen hundred and fifty dollars (\$1,750.00) to defray the expense.

ROOF.

The roof of the building has been badly neglected in the past, and it is almost imperative that special provision be made in order to arrest the damage that is being done to the building from rains through defects in the roof. Although strenuous efforts have been made recently toward preserving the building by making emergency repairs to the roof, the architect who superintended the construction of the building advises that the stone cornices, walls and copings should be covered with sheet copper. Knowing that both the inside and outside walls are continuously wet and being materially and permanently damaged by water and freezing, and believing the architect's suggestion the best and safest plan by which the roof may be put in good condition, I have caused to be made by said architect a conservative and reliable estimate of the cost, and I therefore recommend that the sum total of his estimate of thirty-three hundred and ninety dollars (\$3,390.00) be appropriated to make said repairs.

CUSTODIAN'S SALARY.

I would recommend that the Custodian's salary be increased from fifteen hundred dollars (\$1,500.00) to two thousand dollars (\$2,000.00) per year, and that provision be made to pay said rate of salary to Custodian beginning April 15, 1907. This recommendation is made in view of the fact that the salary of the Custodian is the same now as it was when the office was created nearly eighteen years ago, since when the necessary living expenses have increased from 30 to 50 per cent. The building is now at an age when constant repairs must be made. The large number of Boards and Commissions, and various other minor departments, have been created from time to time, until the number of officials and employes is more than double, requiring the same proportion of attention and service from this department. In addition, various societies and associations are constantly asking for rooms provided with chairs, tables, etc., for their meetings, all of which has enlarged

the field of opportunity for the Custodian to earn a larger compensation. I make the above recommendation feeling that it is in keeping with the growing importance of the office and commensurate with the service rendered and the responsibility assumed.

SALARIES OF ASSISTANTS.

I recommend that the salaries of the Custodian's assistants remain as they are, except that the office of Clerk be dispensed with after July 1, 1907, and that the service heretofore performed by the Clerk in the department be performed by the Custodian and the Assistant Custodian. In view of this proposed arrangement I would recommend that the salary of the Assistant Custodian be increased from nine hundred dollars (\$900.00) to twelve hundred dollars (\$1,200.00) per year. Thus I am enabled to make a reduction in the annual appropriation for salaries to assistants of six hundred dollars (\$600.00). I therefore recommend that there be appropriated annually for salaries of assistants for the fiscal years beginning November 1, 1907, and November 1, 1908, the sum of fourteen thousand seven hundred and sixty dollars (\$14,760.00), and that one hundred and seventy-five dollars (\$175.00) be appropriated to pay the Assistant Custodian's increase of salary for the last seven months of the year 1907, to become available April 1, 1907.

FLAGS AND DECORATIONS.

I would recommend that the annual appropriation of one hundred and fifty dollars (\$150.00) be renewed for flags and decorations for the building.

REPAIR AND SUPPLY FUND.

I would recommend that the annual appropriation of five thousand dollars (\$5,000.00) for repairs and supplies be renewed.

RE-DECORATING.

The appropriation of ten thousand dollars (\$10,000.00) by the last General Assembly for re-decorating has been expended with the exception of fifteen dollars and forty cents (\$15.40), and the work is not more than half completed. All the corridors and rooms on the first floor, all the corridors and all the rooms on the

second floor, except the House and Senate, and lobbies, Supreme Court room, Lieutenant-Governor's and Speaker's room, and all the rooms of the third floor except the Museum have been decorated, leaving yet to be decorated the Senate and House, and lobbies, Supreme Court room, Lieutenant-Governor's and Speaker's rooms, Museum and all the third floor corridor, which includes the skylights and all other iron work of the rotunda. The unfinished surface yet to be decorated is of a more artistic design, and will require a very high grade of work and more expensive than what has already been completed. Therefore, I ask for the completion of this work as indicated above an appropriation of ten thousand seven hundred and fifty dollars (\$10,750.00). This estimate is based on figures furnished by the architect and from other reliable sources. I ask that this appropriation be made available April 1, 1907.

REVARNISHING WOODWORK.

The appropriation of one thousand dollars (\$1,000.00) for revarnishing the outside doors has been expended in full, and it was here that we learned that the woodwork in the building is being permanently damaged for want of revarnishing, more especially the exposed parts, such as the window sills and casings, which are in urgent need of revarnishing and for this work I recommend an appropriation of fourteen hundred dollars (\$1,400.00), to become available July 1, 1907.

The appropriation of twenty-seven hundred and fifty dollars (\$2,750.00) for revarnishing furniture and interior woodwork of the State House made available November 1, 1904, was not used because it did not become available early enough to have the work done and sufficiently dried before the meeting of the General Assembly, and although the fund was allowed to revert to the general fund the work was done and paid for out of the Governor's contingent fund.

WATER FUND.

I recommend an annual appropriation of twenty-three hundred dollars (\$2,300.00) for water for the fiscal years 1908-'09. A reduction of five hundred dollars (\$500.00) is made in this fund by reason of the changing of the passenger elevator from water power

to electric power. In this connection I desire to call attention to the accruing of an account for electric power since the new passenger elevator has been installed (from January, 1906, to October 23, 1906), amounting to two hundred and seventy-one dollars and thirty cents (\$271.30). I estimate to meet this deficiency and the accumulating bills from October 23, 1906, to November 1, 1907 (when the new illuminating and power fund becomes available); the sum of seven hundred and forty dollars (\$740.00), to become available July 1, 1907.

I also recommend an appropriation of twenty-four dollars and twenty-five cents (\$24.25) to meet a deficiency in water fund of 1904-'05 by reason of an outstanding bill, to become available April 1, 1907.

ILLUMINATING AND POWER FUND.

I would recommend that for illuminating the State House and for electric power for the passenger elevator that an appropriation of five thousand dollars (\$5,000.00) be made for the fiscal year beginning November 1, 1907; three hundred and sixty dollars (\$360.00) of this increase is for electric power for the passenger elevator, five hundred dollars (\$500.00) to prevent a deficiency which has occurred in the illuminating fund for several years, and six hundred and forty dollars (\$640.00) in anticipation of extra illuminating service in redecorating. For the fiscal year beginning November 1, 1908, I would recommend an appropriation of six thousand dollars (\$6,000.00). The increase for this period is asked in order to meet the extra illuminating and power current required by reason of the regular meeting of the General Assembly.

I would also recommend a specific appropriation of twenty-five hundred and twenty-eight dollars and seventy-nine cents (\$2,528.79) be made to liquidate a deficiency in the illuminating fund for the fiscal years 1904-'05 and 1905-'06, and that the same become available April 1, 1907.

FIRST INDIANA STATE CAPITOL BUILDING, CORYDON. ERECTED 1811.

In good state of preservation and, with an addition thereto, is now used as a
court house.

STATEMENT OF THE APPROPRIATIONS MADE FOR THIS DE-
PARTMENT FOR THE LAST FOUR YEARS.

CONCLUSION.

In conclusion, I desire to extend my thanks to the officials and employes for their kind forbearance and courteous treatment to myself and assistants. I do most earnestly and cheerfully commend the employes of this department for the faithful manner in which they have performed the several duties assigned them, the energy displayed in doing much, the pride exemplified in doing well, and the courtesy shown to the people they meet and serve entitles them to special mention.

OTWAY A. BAKER,
Custodian Public Buildings and Property.

INDIANA STATE CAPITOL BUILDING, INDIANAPOLIS. ERECTED 1832.

Formerly stood on site of the present State House.

REPAIR AND SUPPLY FUND.

Under which the members of the first Constitutional Convention met at Corydon, Ind., on June 10, 1816, to deliberate upon the articles of the organic law to be adopted for the government of the new State of Indiana. This huge tree still stands in all its grandeur, being one of the finest specimens of our early forest, aside from its historical significance.

Henry Board, janitor, 25 days at \$1.70	
per day	42 00

REPORT OF THE PRESIDENT OF THE BOARD OF TRUSTEES.

To the Governor of Indiana:

Section 13 of the Act of 1865, creating the Indiana State Normal School, is as follows:

“Said Board of Trustees shall biennially make a report to the Legislature, setting forth the financial and scholastic condition of the school; also making such suggestions as in their judgment will tend to the improvement of the same.”

In compliance with the requirements of this section of the statute, I have the honor to submit herewith the report of the institution for the two years ending October 31, 1906, accompanied by such recommendations as in the opinion of the Board of Trustees the interests of the institution require.

The report of the President of the Faculty sets forth quite fully the scholastic condition of the school, and the reports of the Secretary and Treasurer show the financial transactions of the institution for each of the two years ending respectively October 31, 1905, and October 31, 1906.

By reference to page 15 it will be seen that the institution has been more prosperous than during any other biennial period in its history. During the year ending October 31, 1905, the school enrolled 1,908 different students, and in the year ending October 31, 1906, 2,020 different students. The average term enrollment during each of these years was considerably larger than ever before. On page 15 of the report of the President of the Faculty is a tabulated statement of the attendance by terms since the organization of the school nearly thirty-seven years ago. It will be seen that throughout its history the attendance during the fall and winter terms has been relatively small, while the spring attendance for many years has been very large. The summer term, also, which was added twelve years ago, has

grown to be very large, 854 students being present during the summer term of 1906. In the fall and winter all the schools of the State are in session and nearly all the available teachers are required for teaching these schools. For several years past there has been a great scarcity of teachers, and the demand for professionally trained teachers has never before been so great. This accounts for the relatively small attendance in the fall and winter. When the rural and village schools of the State close, the latter part of March, great numbers of these teachers come to the Normal School for the spring and summer terms. During the spring term it is necessary to employ a large number of temporary teachers, that the classes may be kept within proper limits for good teaching work.

The demands upon the institution are constantly increasing. The public school work of the State is expanding—particularly the work of the high schools; more subjects are taught, and a wider range of subject matter is required to be taught in the Normal School. This fact and the increased attendance have made it necessary to enlarge the faculty materially within the past two years. Several new departments have been created, and a number of professors and assistant professors employed for this additional work.

For many years the institution has felt the need of some mature, competent woman to act as Dean of Women, but its financial condition has not until recently permitted the employment of such a person. We are glad to say that, at the opening of the year 1905, we were able to secure the services of a competent woman to give special attention to the interests of the young women of the school.

The library has grown to be one of the most important features of the school. When the fire occurred in 1888 that destroyed the Normal School building, it left the institution without any books, the entire library—the accumulation of eighteen years—being destroyed. Since that time a library fee of \$2.00 per term has been collected from each student. This has yielded about \$62,500. This large sum

of money, supplemented by small sums taken from time to time from the institution's general fund, has been devoted to the building up of this library. Today the institution has more than 40,000 well-selected volumes, constituting, we think, one of the very best libraries in the State, and purchased mainly out of the proceeds of this library fee collected from the students.

Special attention is directed to the statement of the President of the Faculty on page 19 of this report regarding the Rural Training School, which was established five years ago. So far as is known, this is the only normal school in the United States maintaining a distinct rural school as an integral part of its training school. A large proportion of the students of this institution come from the country and go back to the rural districts to teach. It has been deemed important, therefore, to add to the facilities for observation and practice a typical country school. The value of this school has been fully demonstrated by the great and helpful use made of it by our students as a school for observation and practice.

Two years ago the institution asked the General Assembly to appropriate \$10,000 for the completion of the fourth story of the new Model or Training School building, and for \$100,000 with which to establish two dormitories for the young women of the school. The Legislative Investigating Committee recommended that the institution try to complete this building out of the funds produced by the tax and it did not recommend any appropriation for dormitory purposes. Following the recommendation of the committee, we have set aside \$10,000 to be used for completing the Training School building, and this work will be done in the summer vacation of 1907. The setting apart of this \$10,000 has been made possible only by practicing great economy, by having many classes entirely too large for satisfactory instruction, and by refusing to establish departments which the school greatly needs.

The joint Committee of Ways and Means of the House, and the Finance Committee of the Senate, recommended

that \$50,000 be appropriated for the construction of one dormitory. When the bill was reported to the House, however, this item was found not to be included. When the bill went to the Senate it was amended to include this item. The conference committee struck this out of the bill, but inserted an item of \$10,000 to complete the Training School building. The report of the conference committee was accepted by the House, but when the bill was engrossed this item was found not to be included.

As before stated, the institution has built up an extensive library of more than 40,000 volumes, paid for mainly by the fees collected from students. Other small sums have been taken from year to year from the General Fund. A library which could not be replaced for much more than \$100,000 has been built up in this way. It is in a building that has no elements of fire-proof construction and is, therefore, exposed constantly to the danger of entire loss by fire. Realizing this great danger, and because the present library room is insufficient and is greatly needed for other purposes, we have bought a site for a new library building and have had drawings and estimates for the same made. These have been filed with the Governor. We respectfully ask that an appropriation of \$99,970 be made for the construction of a suitable fire-proof library building for this valuable collection of books, maps, charts, etc.

We also ask that an appropriation of \$91,495 be made for the purchase of a site for and the construction of a suitable dormitory for young women.

For a further statement of the grounds of these requests we refer you to the presentation of these needs by the President of the Faculty elsewhere in this report.

Respectfully submitted,

WM. H. ARMSTRONG,
President Board of Trustees.

REPORT OF THE PRESIDENT OF THE FACULTY.

Hon. William H. Armstrong, President Board of Trustees, Indiana State Normal School:

Under the various headings which follow I present a brief report of the scholastic condition of the institution for the two years ending October 31, 1906:

THE FACULTY.

The faculty consists of the President, who is also the head of the Department of Philosophy of Education; the Vice-President, who is also the head of the Department of Psychology, Introspective and Experimental; twenty other heads of departments; ten assistant professors; nine training school teachers; three assistant librarians and four laboratory assistants. In the spring term of each year the attendance is more than double that of the fall and winter terms, and this makes necessary the employment of ten or more temporary teachers. It has usually been found practicable to secure the services of a number of competent graduates of the school and of other institutions that have had successful experience in teaching, and who, owing to the shortness of their own terms of school, are available for this period. While this arrangement is not so satisfactory as it would be to have permanent teachers enough to teach all the classes at all times in the year, it is, nevertheless, the best the school can do under the circumstances and meets fairly well the needs of the increased attendance during this term of the year.

ATTENDANCE.

The school has enjoyed a high degree of prosperity during the two years covered by this report. In the year ending October 31, 1905, 1,908 students were enrolled; in the year ending October 31, 1906, the enrollment of different

students reached 2,020. A very decided advance in the grade and attainments of students in the institution is noticeable from year to year. During the past two years there has been an increase in the number of college graduates and undergraduates in attendance, in the number of high school graduates, persons holding high grades of county or State licenses and others of good attainments. This fact enables the school to do a higher grade of scholastic work than in former years. Many of these persons, too, are teachers of one or more years' experience, who have dropped out of teaching for a time that they might better equip themselves for the work of the school room.

THE SUMMER SCHOOL.

In the summer of 1894 a six weeks' summer school was conducted as a private enterprise by a number of members of the faculty, a small tuition being charged. One hundred and ten students enrolled. The school was continued on the same plan during the two summers following, the number of students increasing to 306. It thus became evident that there was a strong demand for a regular summer term of school as a part of the school year. It was decided to establish this under the direction of the trustees and conduct it regularly as an integral part of the work of the school year. The attendance at once doubled, and has since grown to 854 different students, this being the number present in the last summer term. Most of the persons who attend the summer term teach throughout the school year and have, therefore, no opportunity to attend school except in the summer vacation. It is of the greatest benefit to these persons to attend the Normal School. Although the regular school year was thus increased from thirty-nine to forty-five weeks and the expense increased in the sum of about \$9,000 per year, it has been found practicable thus far, by practicing rigid economy, to meet the additional expenses incident to carrying on the summer term. While the adding of the summer term has had the effect to decrease the attendance slightly in the fall and winter, it has yet ex-

tended the benefits of the school to a larger class of teachers and students than would otherwise be reached.

The library is growing at the rate of three thousand books or more per year, and the laboratories and other departments are from year to year coming to have completer and more modern equipment.

The gymnasia added seven years ago have fulfilled their promise in the better health and more vigorous life of the student body. A certain amount of systematic exercise in the gymnasia under competent direction is not only not a loss of time to the student, but is a distinct gain in the more vigorous and fruitful mental activity which is thereby stimulated.

Throughout the past two years the utmost harmony in the faculty and between the students and faculty has prevailed, and the spirit of earnest inquiry and study on the part of everybody connected with the school has never been more commendable.

THE LIBRARY.

The demand constantly made by our students and by teachers over the State for a more thorough course in the use and management of libraries, led to the establishment, in January, 1906, of a department of Public School Library Science. While it is the purpose of the department to emphasize the relations of libraries and schools and to meet the needs of schools and colleges, there is no essential difference in the training here offered and that which is the necessary equipment of the public librarian.

Three courses of instruction, consisting of a year's work as one of four subjects of study usually pursued at one time, are offered in this department, to which all students of the school are eligible. Credits for satisfactory work done are given on the regular curriculum of the school. Course I is on the Use of the Library in Public School Work, the object of which is to prepare the teacher for intelligent, systematic and scholarly use of collections of books. Courses II and III are on the Organization and Management of School Libraries, which are designed to teach the more technical work of the school librarian.

The library on July 1, 1906, contained 40,158 volumes, widely distributed as to subjects, but especially strong in pedagogical literature. The old library having been entirely destroyed in the fire of 1888, the books are all comparatively new, and therefore have a reference value which even the number does not indicate. They are classed and catalogued upon the most approved methods. The library is ministered upon the principle of the freest and best use of the books consistent with the interests of all. To this end, students, as well as professors, have complete access to the shelves during the day, and almost any book may be drawn for the night at the close of the afternoon session of the school. The only general fee charged in the school, aggregating \$5,000 annually, is used exclusively in the purchase of books, binding and periodicals.

This large and valuable collection is in constant danger of fire, owing to its proximity to the boiler house and to the chemical laboratories. The destruction of this library would mean not only the destruction of nearly \$100,000 worth of books and catalogues, which are constantly increasing in value, and many of which could not be replaced at any price, but it would also mean the loss of many years of effort and the crippling of the work of the institution for a long period. Hence the necessity for a fire-proof building.

Other serious questions confronting the librarians are the storage of books and the care of students in the reading room. Many sections of the stack-room are crowded, which prevents any great number of accessions in those departments. The space for readers in the present quarters is already quite severely tested at times throughout the year, but especially during the spring term. However, it is not well to increase the size of this room, but the outlet should be through other special rooms, such as a periodical room, a public document room, a classroom for the teaching of library science, etc.

The Trustees, appreciating the needs of the library, have purchased a piece of ground, with the hope of erecting a substantial, fire-proof building in the near future.

STATISTICS.

The following table exhibits the number enrolled during each term since the organization of the school, the average term enrollment for each year, and the whole number of different students for each year:

YEAR ENDING.	ENROLLMENT.				Average Term Enrollment.	Whole Number of Different Students for the Year.
	Winter Term.	Spring Term.	Summer Term.	Fall Term.		
October 31, 1870.....	40	66		36	47	98

Since the organization of the school in 1870 students have registered from the various counties of the State as follows:

Adams 56, Allen 116, Bartholomew 241, Benton 187, Blackford 73, Boone 386, Brown 79, Carroll 580, Cass 274, Clark 274, Clay 804, Clinton 333, Crawford 54, Daviess 437, Dearborn 195, Decatur 203, Dekalb 62, Delaware 164, Dubois 147, Elkhart 146, Fayette 124, Floyd 132, Fountain 266, Franklin 414, Fulton 169, Gibson 241, Grant 248, Greene 419, Hamilton 156, Hancock 287, Harrison 98, Hendricks 642, Henry 389, Howard 481, Huntington 428, Jackson 235, Jasper 159, Jay 110, Jefferson 173, Jennings 155,

Johnson 206, Knox 612, Kosciusko 198, Lagrange 186, Lake 53, Laporte 68, Lawrence 319, Madison 571, Marion 563, Marshall 103, Martin 139, Miami 205, Monroe 103, Montgomery 515, Morgan 587, Newton 180, Noble 96, Ohio 24, Orange 230, Owen 612, Parke 783, Perry 83, Pike 102, Porter 12, Posey 305, Pulaski 124, Putnam 509, Randolph 252, Ripley 260, Rush 186, Scott 103, Shelby 234, Spencer 226, Starke 50, Steuben 35, St. Joseph 133, Sullivan 713, Switzerland 139, Tippecanoe 314, Tipton 128, Union 55, Vanderburgh 138, Vermillion 402, Vigo 4,683, Wabash 572, Warren 224, Warrick 247, Washington 378, Wayne 440, Wells 195, White 265, Whitley 92.

WHENCE THEY COME.

During the past two years each of the ninety-two counties of the State has had representatives in the school as follows:

Adams 3, Allen 8, Bartholomew 74, Benton 2, Blackford 7, Boone 17, Brown 15, Carroll 23, Cass 20, Clark 35, Clay 133, Clinton 18, Crawford 12, Daviess 82, Dearborn 31, Decatur 22, Dekalb 12, Delaware 10, Dubois 22, Elkhart 15, Fayette 10, Floyd 22, Fountain 30, Franklin 43, Fulton 14, Gibson 28, Grant 15, Greene 57, Hamilton 17, Hancock 24, Harrison 10, Hendricks 61, Henry 25, Howard 18, Huntington 42, Jackson 38, Jasper 15, Jay 8, Jefferson 16, Jennings 31, Johnson 16, Knox 95, Kosciusko 14, Lagrange 20, Lake 6, Laporte 9, Lawrence 83, Madison 65, Marion 64, Marshall 14, Martin 24, Miami 8, Monroe 35, Montgomery 21, Morgan 35, Newton 14, Noble 18, Ohio 2, Orange 30, Owen 82, Parke 29, Perry 16, Pike 26, Porter 3, Posey 50, Pulaski 6, Putnam 27, Randolph 22, Ripley 48, Rush 21, Scott 12, Shelby 21, Spencer 28, Starke 2, Steuben 3, St. Joseph 9, Sullivan 92, Switzerland 13, Tippecanoe 14, Tipton 9, Union 4, Vanderburgh 8, Vermillion 52, Vigo 562, Wabash 16, Warren 13, Warrick 16, Washington 52, Wayne 22, Wells 18, White 21, Whitley 7.

The attendance from Vigo County includes many who have removed to Terre Haute from other counties to have the advantages of the school and who should not be credited to Vigo County.

COURSES OF STUDY.

COURSES ARE OFFERED AS FOLLOWS:

Algebra.....	Four courses.
Arithmetic.....	Two courses.
Botany.....	Seven courses.
Calculus.....	Two courses.
Chemistry.....	Six courses.
Composition.....	Four courses.
Drawing.....	Six courses.
European History.....	Seven courses.
Geography.....	Six courses.
Geometry.....	Five courses.
German.....	Fifteen courses.
Grammar.....	Three courses.
History of Education.....	Eight courses.
History and Teaching of Mathematics.....	One course.
Latin.....	Fifteen courses.
Literature.....	Eight courses.
Manual Training and Mechanical Drawing.....	Six courses.
Methods.....	Two courses.
Music.....	Six courses.
Observation.....	Two courses.
Penmanship.....	One course.
Physical Culture.....	Three courses.
Physics.....	Six courses.
Physiology.....	Five courses.
Practice.....	Two courses.
Psychology.....	Six courses.
Reading.....	Two courses.
Trigonometry.....	One course.
United States History and Civil Government.....	Nine courses.
Zoölogy.....	Six courses.

A course means thirteen weeks, five hours a week.

TRAINING SCHOOLS OF THE INDIANA STATE NORMAL SCHOOL.

From the organization of the Indiana State Normal School there has existed as one of the departments a school for observation and practice. This school, formerly located in the Normal School building, now occupies a new building erected and equipped especially for its work. It constitutes the eleventh district of the Terre Haute city schools and contains the grades from the first grade to the high school, organized as are the regular grades in the other districts of the city schools. This Training School has during all these years afforded the students of the State Normal School ample opportunity to observe the work in the different grades of a city school system. It has also given opportunity for the planning and presentation of lessons in such schools. The observation and practice are of such a nature as to make the students acquainted with the course of study, program, mode of discipline, processes in teaching, reports to principals and superintendents, supplementary reading work, examinations, etc., incident to a city school system. The results obtained from the observation and practice work in these grades of the city schools have always been held to be among the valuable results arising from a course in the State Normal School.

Quite a number of graduates have obtained positions in the country schools after graduation, and many of the undergraduates have taught for a considerable period in the country schools after taking a portion of the course in the Indiana State Normal School. In addition to this, almost all of both classes have received much of their education in the rural schools. They have, therefore, become accustomed to the meager equipments, to the frequent changes of teachers, to the inexpensive papering by unskilled workmen, to the general lack of repairs, and to the

neglect as to coalhouses, outbuildings, etc., which are only too common in the rural schools of the State. In consequence, it has long been felt that the Indiana State Normal School would more adequately fulfill its service to the State by establishing a Rural Training School, in order to give to the students of the school an opportunity to observe and practice systematically in such schools, and thereby to become acquainted with the peculiar difficulties, as well as the peculiar advantages, belonging to such a school, and to make, in addition, a study of the rural school problem as a whole.

As a result of these considerations, arrangements for such a school were completed during the summer of 1902 and at the beginning of the school year in September of the same year a Rural Training School was organized. The school selected is not a village or town school, but essentially a typical country school, presenting the usual peculiarities and difficulties of such a school. It is School No. 6, at Chamberlain's Crossing, in Lost Creek Township. It is situated six miles east of Terre Haute, on the interurban line between Terre Haute and Brazil. The agreement was entered into between the Board of the Indiana State Normal School, as party of the first part, and Joseph Ripley, trustee of Lost Creek Township, as the party of the second part. It provides that School No. 6, situated as above noted, shall be used by the students of the Indiana State Normal School as an observation and practice school. It also provides that repairs, improvements, apparatus, etc., beyond those usually provided by the trustee for the country schools, shall be paid for jointly by the trustee and the Normal School Board. A further provision is that the teacher during the seven months of the school year (the period during which the schools of the township continue) shall be paid the maximum salary by the trustee, and a certain fixed amount in addition by the Board of the Indiana State Normal School, and that, during the continuance of the school beyond the seven months, so as to complete the period of ten months, the teacher shall be paid by the Board

of the Indiana State Normal School. The compensation for the janitor is also, according to the agreement, to be provided for by the State Normal School Board.

The grades, course of study, etc., are to be in accordance with the rural schools of the township and county, but the department of pedagogy in the State Normal School is to make any variations in programs or processes of teaching, apparatus, etc., that may be required for the work in observation and practice. The school is to be open for observation to the teachers of the township and county in general.

The school has now been in successful operation for four years, and last year graduated a class of eleven from the eighth grade, most of whom will apply for admission to the city high school. The Rural Training School is equipped and conducted to show what a district school ought to be and to show that scientific teaching can be done even under the necessary limitations of such schools.

That the school is meeting the need for which it was organized is shown by the fact that a class from the Normal School observes and teaches in the school a portion of every term and students from all classes are encouraged to visit it. Its good influence is further shown by the constantly increasing number of teachers and school officers who visit it from different counties of the State. During the last school year more than three hundred spent one or more days in visiting the school.

REPORT OF THE BOARD OF OFFICIAL VISITORS, 1904-1905.

(Extract from an Act Approved March 5, 1873.)

The State Board of Education shall appoint annually in the month of June, or at its first meeting thereafter, a committee of three, who shall constitute a Board of Visitors, and shall in a body or by one of their number visit said school once during each term and witness the exercises and otherwise inspect the condition of the school, and by the close of the Normal School year they shall make a report to the Board of Trustees. The members of said Board of Visitors shall be allowed five dollars for each day's service rendered, and also traveling expenses, to be paid out of the State treasury.

SPRINGFIELD, ILL., June 1, 1905.

To the Board of Trustees of the Indiana State Normal School:

Gentlemen—The Board of Visitors of the Indiana State Normal School for the thirty-sixth year, 1904-05, begs leave to submit the following report:

The Board, in a body, visited the school May 3, 4 and 5, 1905, and made as careful and thorough inspection of the organization, equipment, management and instruction as the time allowed.

We are of the opinion, and are pleased to report, that the organization of the school is thorough, and in harmony with its specific purpose—the preparation of teachers for the common schools. While a large opportunity is offered to students who have had considerable experience as teachers and may reasonably expect to be called to places that are commonly thought of as more important, there is no doubt that the provisions for foundation work are considered of primary importance. The common branches are the instruments of knowledge, as it is acquired from books. The first care, therefore, very properly seems to be in the direction of thorough and efficient teaching of these branches. To this end they are restudied from the point of the teaching process. The subject-matter is more critically exam-

ined, both in the light of its theoretical pedagogical relations, and the practical work of the training school.

With the occupation of the new training school building—a model of its kind—your committee believes that this important factor in a completely organized Normal School will be fulfilled up to the best modern standard, and this foundation work will be more conveniently as well as even better done.

In this connection we desire to record our unqualified approval of the provision made for a model school in the country. The one-room, one-teacher school will continue for many years to be a type. In it a very large proportion of the children will receive all the school education they ever get. It is becoming increasingly difficult to keep up the supply of teachers for these schools. The country model school, then, is by no means the least important branch of your training department. Moreover, this feature is, so far as the information of your committee extends, peculiar to the Indiana State Normal School.

In the matter of equipment, without entering into detail, we report that all departments are well supplied with working material. The evident need of more space in many of the recitation rooms will be met in good measure when the new training school building is occupied. Further relief will be afforded in due time in another way.

We wish to report our very high opinion of the library. It is not only an unusually large one, but has been remarkably well chosen and organized, whether from the point of view of the needs of the young teacher or the advanced student of education. While the rooms occupied by the library are well adapted for their purpose, it is evident that they are outgrown. They are not fire-proof. Should the building be burned, the loss would be irreparable. To replace the present catalogue, with its accumulated cross-references, would be the work of years. With these things in mind, your committee was especially pleased to learn that their only suggestion as to the library had been, in part, anticipated by the purchase of a convenient and suit-

able site upon which to erect a fire-proof building. This we believe to be the next and most evident need of the institution. Considering the importance of safeguarding the library, and its valuable catalogue, and the pressing necessity for a few quite large recitation rooms, which could be provided in the space vacated, it seems to us that the management of the school might well be justified in asking the next Legislature for special and liberal appropriations for the new fire-proof building for the library.

In the management of the school, your committee finds ample ground for high commendation and nothing to condone. During the entire three days of our visit, there did not appear the slightest indication of friction among teachers, not a sign of indolence, inattention or disorder among the students. The institution, to the casual observer, might seem to run itself. Of this feature of the school, your committee desires to be understood as reporting, without reservation, in terms of the highest praise.

Of the instruction we report that, as already intimated, it is adapted to the varied needs of a large student body. The heads of departments are masters of their work. The assistants are well chosen and competent. While it is a matter of regret to us that, within the time limit, we could not see every teacher in classroom work, enough was seen of each department to show that its work was unified, harmonious, well balanced and well done. Everything seemed to be planned with reference to the two facts that the students are teachers of more or less experience seeking growth in teaching power, or students seeking that degree of insight into the teaching art that will justify them in offering their services to the schools, where alone the experience and test of teaching power can be obtained.

Your committee reports that the methods of the department of music, and the evident skill in using them, may well challenge comparison with those of any similar school. The day is not distant when the elementary school teachers will, as a matter of course, be quite well prepared to teach children to sing as they are now expected to be able to teach them to read. The instruction in this art in your school is well calculated to hasten that most desirable consummation.

The difficulty of comfortably and suitably housing so large a student body must be sometimes felt. It is possible that this difficulty may increase. It might not be practicable, perhaps not desirable, to provide dormitories for all, but the utility of a limited provision of this kind, under the control of the school authorities, as a means of setting a standard of student living occurs to your committee as a question that should have the careful consideration of your board at no distant date.

In view, also, of the large number of women students, it would seem desirable that one superior woman, having rank in the faculty as the head of a department, and in administration next to the President, should be appointed and charged with the duties analogous to those usually performed by the dean of women in coeducational colleges and universities. Your committee understands that both of these matters have had some preliminary consideration. Both, in our opinion, would strengthen the organization of the school. The need of the latter seems urgent, and of pressing importance.

In conclusion, we individually desire to record our very high opinion of the great service the Normal School is performing for the State of Indiana. The atmosphere of the school, the attitude of teachers and students, the order, diligence and general sincerity will continue to affect the common schools, in time permeating the whole system with its life-giving influence, thus meriting, as it must certainly receive in increasing measure, the confidence and support of the people of the State.

ALFRED I. BAYLISS,
Superintendent of Public Instruction,
Springfield, Illinois.

R. I. HAMILTON,
Superintendent of Schools,
Vincennes, Indiana.

GEORGE H. TAPY,
Superintendent Whitley County Schools,

REPORT OF THE BOARD OF OFFICIAL VISITORS, 1905-1906.

MILLERSVILLE, PA., June 5, 1906.

To the Board of Trustees of the Indiana State Normal School:

Gentlemen—The Board of Official Visitors, appointed to visit the Indiana State Normal School, Terre Haute, Indiana, and to “witness the exercises and otherwise inspect the conditions of the school,” visited the Normal School during the week beginning May 7, 1906, and beg leave to present the following report of their visit and inspection:

The school has a large enrollment, about 1,250 students being in attendance. Most of the classes are large. On account of the large influx for the spring term of students who have been teaching during the winter months, some of the classes are crowded. The committee were impressed with the earnestness of purpose on the part of the students and their desire to avail themselves of the benefits offered by the school. They were also deeply impressed with the ability and professional enthusiasm of the members of the faculty and the thorough and accurate work done by them.

The maturity of age and development of the students enabled the authorities of the school to give them the freedom that is greatly to be desired in the development of character. The cordial and sympathetic relation between teachers and students is to be admired and commended.

Possibly a suggestion might be made with respect to the number of required and elective studies for graduation. It is probable that an increase in the number of required branches would secure the introduction of such studies as the elements of the Natural Sciences, Manual Training, etc., more extensively in the public schools of the State. Yet in this suggestion the judgment of the President of the school

and faculty should be accepted as being more nearly correct than that of the committee, and it is to be presumed that the arrangement of required studies and electives is the one that most fully meets the needs of the schools of the State.

If any suggestions were to be made with respect to the courses of study, it might be that the part of the professional course generally included under the name of "Methods" should be more extensive. But the brief time spent at the school by the committee prevented them from becoming fully acquainted with the work done in this department. In addition to the professional work of the school, much academic work is done in the classes. Both these sides of the teacher's preparation belong in a properly equipped normal school. The high school or college departs from its purpose when it attempts to teach the academic studies as a teacher must know and teach them. As a matter of fact, high schools and colleges do not conduct their classes with the object of teaching teachers. This work is partly professional in its character, and is properly left for the normal school faculty. At Terre Haute the academic work is thoroughly done. A broad foundation is laid upon which to build the purely professional course.

The new Model School supplies a real need in the normal school equipment, and is well adapted to the purpose for which it is used. It is believed that the seniors should be afforded every opportunity to teach in the Model School under careful supervision. Too much well-directed practice in the art of teaching can not be given to students in one year.

The Normal School possesses one of the most valuable libraries of any normal school in the country. A new fire-proof building is greatly needed to preserve the valuable collection already made, and to provide for its increase. There is not room enough for the students to make the use of the books which they should make, and desire to make. The committee saw the library rooms crowded with earnest students, working in insufficient space, and consequently working at a disadvantage.

We strongly recommend that a new building specially planned by a competent architect, and detached from the other buildings, be erected exclusively for library purposes.

The committee also suggests that rooms for gymnasium exercises be provided above ground, with better light and ventilation than can be provided in the quarters now devoted to this purpose. For obvious reasons a separate building with a liberal supply of bathing rooms and dressing rooms, in addition to the drill rooms, would be the best provision that could be made for physical exercises. The space now used by the library and gymnasium could be utilized for class rooms, and the present crowded condition of many recitation rooms could then be relieved.

The committee visited the country school, conducted under the direction of the Normal School authorities, and intended to prepare teachers for similar schools. The plan of having a model country school to enable seniors to learn by observation and practice how to conduct a school of this kind is an excellent one, and should be continued. We believe that an extension of this idea would be of great benefit to the hundreds of ladies and gentlemen attending the Normal School. The establishment of a township consolidated school, under the control of the Normal School authorities, and accessible to the students by trolley, would serve as a model for similar schools throughout the State, and greatly stimulate the establishment of consolidated schools.

All the students lodge in private homes near the school buildings, and board either in these houses or in clubs elsewhere in the city. Difficulty must arise when it is necessary for so many young ladies and gentlemen, a large number of whom are strangers in the city, and some unacquainted with city life, to find proper places in which to live while attending school. It seems to your committee that a building large enough to provide lodging for two or three hundred ladies is an immediate necessity, when all the conditions are considered, and we earnestly recommend that a dormitory of the capacity suggested be erected and furnished and placed under the control of the Normal School

authorities. A building of this kind would probably bring to the Normal School a number of students to take a course in professional preparation before teaching in the public schools. This would seem desirable.

In conclusion, it is proper to state that, while every courtesy was shown to the committee by the president and faculty, there was no effort made to have us see only the brilliant and more attractive features of the school, but every facility was afforded to see everything connected with the institution, and the committee were free to use their own discretion with respect to what should be examined. This freedom enabled us to form a fairly accurate opinion of the real work done by the institution. We desire to express the opinion that the Indiana State Normal School is admirably organized to accomplish the purpose for which it has been established, and that it is rendering the State most excellent service in the preparation of teachers for its public schools. It is our belief that it ranks with the best schools of its kind in this country. Whatever is invested in this institution reaches every part of the great State, and is returned to the people many fold by making the public schools better, and consequently by aiding in securing more intelligent and better citizenship.

E. O. LYTE, Chairman,
Principal, First Pennsylvania State Normal School,
Millersville, Pennsylvania.

HAROLD BARNES,
Superintendent of Schools,
Princeton, Indiana.

EDSON B. SARBER,
Superintendent of Schools,
Kosciusko County, Indiana.

NEEDS OF THE SCHOOL.

In the report submitted for the two years ending October 31, 1902, requests were made for an appropriation of \$5,000 for the purchase of an athletic park, and of \$70,000 for purchasing ground and erecting a suitable building thereon to be occupied by the Model or Training School and the Department of Manual Training. The General Assembly saw fit to appropriate only \$50,000 to be used for a Training School building. At the same time, however, the tax levied for the use and benefit of the institution was increased from two-fortieths to three-fortieths of a mill. With the increased funds at its disposal the institution purchased and equipped a suitable athletic park, and later purchased a site for and awarded contracts for the erection of a new Model or Training School building. The ground on which this building has been erected cost \$15,600, and the building itself, including the heating and lighting plant, but not including the fourth story, which remains uncompleted, cost \$68,212.16. The sum of \$33,812.16, for the Training School building and grounds, over and above the \$50,000 granted by the Legislature, was paid out of the increased funds produced by the tax. To do this, however, it has been necessary to practice the strictest economy during the period of four years. The salaries of the professors were kept at a low figure, their work has been necessarily very heavy and many of the classes have been entirely too large.

In the report for the two years ending October 31, 1904, the institution asked for an appropriation of \$10,000 for completing the fourth story of this building, and for \$100,000 with which to purchase a site for and erect thereon suitable dormitories for women. The legislative committee appointed by the Governor recommended that the institution try to complete the fourth story of its Training School building out of the funds derived from the tax.

The joint Committee of Ways and Means of the House and the Finance Committee of the Senate voted to recommend an appropriation of \$50,000 for the construction of one dormitory. It did not recommend an appropriation for completing the Training School building. When the general appropriation bill was reported to the House it was found that this item of \$50,000 was not included. The bill was passed by the House as introduced, but amended by the Senate to include the item of \$50,000. In the conference committee this item was taken out, but the \$10,000 for the completion of the Training School building was inserted. Both houses accepted the report of the conference committee, but when the bill was engrossed this \$10,000 item was omitted and no appropriation was therefore made for either the completion of the Training School or the construction of a dormitory for women. Again, by practicing rigid economy and by permitting many classes of unusual and abnormal size, the institution has been able to set apart \$10,000 for the completion of the new Training School building, and with this amount it is the intention in the summer vacation of 1907 to have this work done.

In 1888 the State Normal School was visited by a disastrous fire which destroyed its building, furniture, laboratories and entire equipment. Perhaps the greatest loss was the destruction of its library, the accumulation of eighteen years. Since that time, however, it has built up an extensive and valuable library, consisting of more than forty thousand volumes. These books have been mainly purchased with the proceeds of a library fee of \$2 per term, which is devoted entirely to library purposes. Since the fire of 1888 the students have paid in the form of library fees the large sum of about \$62,500. With this and certain amounts which it has been possible to spend from year to year out of the funds derived from the tax, a large and valuable library has been built up. We estimate that this library with its furniture, maps, charts, etc., and its valuable card catalogue—all the accumulations and results of eighteen years' labor—represent at least \$100,000 in value. If the institution were to suffer another fire, it would be im-

possible with much more than \$100,000 to replace this valuable collection of books and material and this catalogue.

The library is on the first floor of one of our buildings, which is used for general school purposes. In the basement are the two gymnasiums, on the third floor are the chemical, physical and biological laboratories, and on the fourth floor the association and literary rooms. The building has no qualities of a fire-proof construction, and is therefore exposed constantly to the danger of loss by fire. The library room has also become insufficient for the large attendance, particularly during the spring and summer terms. The room is also greatly needed for the work of other departments of the school. Feeling the imperative necessity that this valuable collection should be housed in a strictly fire-proof building, we have purchased a site for the new library building and have preliminary drawings and estimates made for the same by competent architects. These drawings and estimates have been filed with the Governor, as required by the act of the General Assembly, approved March 2, 1905, with the request that an appropriation of \$99,970 be made for the purpose described.

As set forth in the report of 1904, the institution has long felt the need of dormitories for its young women. It is often difficult to secure suitable rooms enough for the large number of young women in attendance. In many cases the young lady students have been obliged to occupy rooms that were ill suited to the needs of students preparing to be teachers in the public schools of the State, and sometimes the charges for these rooms were excessive. We feel that there is a very urgent and pressing need that at least one dormitory should be constructed for the use of the young women. This should be plainly but neatly furnished and should be well lighted, heated and ventilated. The rooms should be rented to the young women at fair prices. This would set a standard for rooms, and would tend to secure comfortable, suitable rooms for the entire student body and at reasonable rates. This dormitory would be self-sup-

porting, entailing no further expense upon the State after its establishment.

Feeling the great need of a dormitory for women, we have had preliminary drawings and estimates made for such a building, and these have been filed with the Governor. The architects' estimates covering all classes of work and material amount to \$75,495. We estimate that a suitable site within reasonable proximity to the school buildings could be purchased for about \$6,000, and that it would require \$10,000 for furnishings. We therefore respectfully ask that an appropriation of \$91,495 be made for this purpose.

It is proper to add that the school has greatly expanded during the last four years, the courses of study being increased and the faculty enlarged. To meet the increased demand upon the school from year to year will require the entire proceeds of the tax. Indeed, it will require the closest economy to carry the school through the ensuing biennial period at its present high standard on the proceeds of this tax.

Greater demands are being made from year to year upon the teachers of the State. They are required to have broader scholarship and richer attainments in every way. Notwithstanding this fact, their salaries have not been materially increased. As the State wishes to attract to its school maintained for the preparation of teachers for teaching in its public schools the best grade of young men and young women possible, we feel that appropriations for the two purposes herein set forth should be made that the institution may in larger degree fulfill the object for which it was organized and is maintained.

No increased maintenance is asked for the ensuing biennial period.

Respectfully submitted,

WM. W. PARSONS,
President of the Faculty.

REPORT OF THE SECRETARY OF THE BOARD OF TRUSTEES.

INDIANA STATE NORMAL SCHOOL,
TERRE HAUTE, IND., Nov. 1, 1905.

Hon. William H. Armstrong, President:

Dear Sir—I herewith submit my report of the receipts and expenditures of the Indiana State Normal School for the fiscal year ending October 31, 1905:

The funds of the institution are paid out only on the presentation of itemized bills, approved by the Board of Trustees, which are duly receipted and paid. These vouchers are then filed with the Auditor of State and duplicates of the same are preserved in the institution's fire-proof vault.

The report of the Treasurer agrees with that of the Secretary in showing a balance on hand of \$27,766.58. Attention is called to the fact that the scholastic year does not correspond with the State's fiscal year. Only two-tenths of the school year is past, and the balance on hand at the end of the fiscal year, with what is received on the first of the following January, must carry the school through the remaining eight months of the academic year.

Respectfully submitted,

JOSHUA JUMP,
Secretary.

FOURTH BIENNIAL REPORT

OF THE

Public Library Commission

OF INDIANA

From November 1, 1904, to
October 31, 1906

INDIANAPOLIS:

WM. B. BURFORD, CONTRACTOR FOR STATE PRINTING AND BINDING
1907

THE STATE OF INDIANA,
EXECUTIVE DEPARTMENT,
December 22, 1906. }

Received by the Governor, examined and referred to the Auditor of State
for verification of the financial statement.

OFFICE OF AUDITOR OF STATE,
INDIANAPOLIS, January 14, 1907. }

The within report, so far as the same relates to moneys drawn from the State
Treasury, has been examined and found correct.

J. C. BILLHEIMER,
Auditor of State.

JANUARY 14, 1907.

Returned by the Auditor of State, with above certificate, and transmitted to
Secretary of State for publication, upon the order of the Board of Commissioners
of Public Printing and Binding.

FRED L. GEMMER,
Secretary to the Governor.

Filed in the office of the Secretary of State of the State of Indiana, January
14, 1907.

FRED A. SIMS,
Secretary of State.

Received the within report and delivered to the printer January 14, 1907.

HARRY SLOUGH,
Clerk Printing Bureau.

LETTER OF TRANSMITTAL.

INDIANAPOLIS, December 22, 1906.

HON. J. FRANK HANLY, Governor of Indiana, State House:

Dear Sir—Herewith is submitted the fourth biennial report of the Public Library Commission of Indiana.

CHALMERS HADLEY,
Secretary and State Organizer.

PUBLIC LIBRARY COMMISSION OF INDIANA.

OFFICE, STATE HOUSE, INDIANAPOLIS.

Commissioners Appointed by the Governor.

Report of the Public Library Commission of Indiana.

To the General Assembly of the State of Indiana:

In forming its plans for library extension in Indiana, the Public Library Commission has had in mind a single purpose, to give every man, woman and child an opportunity to secure through books that self-culture which must be included in any broad system of education if the people are to be raised to that contentment and successful self-government which makes for true happiness and advancement.

To this end the Library Commission has encouraged the organization of public libraries in as many communities as the people's interest could be enlisted to establish them under the laws of the State, and public opinion insist upon their proper tax support. When libraries have been established, emphasis has been laid upon their proper maintenance in accordance with well established principles of modern library administration.

Recognizing the futility of seeking to improve library conditions without the co-operation of librarians, the Public Library Commission of Indiana has sought to place within the reach of the libraries of the State, facilities for library training through library institutes, library summer schools, instruction in local libraries, correspondence and lectures by experienced librarians from various parts of the country.

To afford the high school graduate the training necessary to successfully administer the tax-supported libraries of the small towns and cities, to give opportunity to the college graduate to acquire knowledge of modern library methods within the border of his own State, the Public Library Commission encouraged the establishment of the Library School at Indianapolis under the auspices of the Winona Technical Institute.

Through the traveling library system the people in unincorporated communities, or towns and cities having no library privileges, have supplied to them the public traveling library; thus the use of good books has been placed within the reach of all the people of the State. These traveling libraries have frequently been

the means of encouraging the establishment of permanent public libraries. They are used, too, to supplement the scanty collections in the smaller tax-supported libraries of the State. The increasing use of the special subject libraries is evidence of the appreciation which this department of traveling libraries has merited. The farmers, through addresses at the Purdue University annual conference of farmers' institute workers and at county farmers' institutes, have increased their knowledge of scientific farming, while their wives and daughters have become more and more interested in home making subjects for reading.

Indiana was the first State to centralize through a Library Commission the library work with schools. By means of instruction in summer library schools, addresses at teachers' and library institutes, courses of lectures in normal schools and visits to local libraries prepared to institute such work, the Library Commission made such a creditable beginning in work with schools that letters and visitors from various parts of the United States have been received, seeking information as to this branch of work.

Closely allied to this is the newer development of courses of library lectures in colleges and universities. Without attempting instruction in technical library processes, college presidents and trustees are beginning to realize the advantage of giving the students at the outset of their college courses such instruction in the use of reference books, indexes, bibliographies and authorities as will render their studies more interesting and vital and provide pleasurable reading in a manner which enriches and safeguards life.

Through its Library Occurrent, publication of various lists, free distribution of printed matter, including the A. L. A. book lists to aid in book selection, through correspondence and visits, the Library Commission seeks to come into closer touch with all library centers of the State and country.

The following report of work accomplished along the lines indicated above will demonstrate to what extent the purpose of the Commission has been effected.

JACOB P. DUNN, President,
ELIZABETH CLAYPOOL EARL,
WILLIAM W. PARSONS,

Public Library Commission of Indiana.

STATE ORGANIZER'S REPORT.

To the Public Library Commission of Indiana:

While the number of libraries organized, buildings erected and traveling libraries circulated, present some of the results of the work of the Public Library Commission in tangible form, much that has been done can not readily be expressed in such a report. The results of the awakening of interest, inducing communities to organize public libraries and reading-rooms, established libraries to introduce better methods into their administration, librarians to fit themselves for more efficient service in the tax-supported libraries, and so co-operate with the schools that the work of teachers and pupils may become more vitalized; become a valuable possession of the people of the commonwealth.

The work of the Public Library Commission has received recognition in the American Library Association. Its representatives have had a share in the organization of the National League of Library Commissions, the constitution of which was adopted at the Indianapolis conference. The Indiana summer school course for librarians complies with the standards set by the Committee on Library Training, as reported at the annual conference held at Narragansett Pier, R. I., June 29 to July 6, 1906. The State Organizer was invited to represent the Indiana Commission at the Portland, Oregon, conference of the American Library Association, the annual meetings of the Ohio and Michigan State Library Associations, and the Cincinnati Library Institute, and to address the library school students at Pratt Library School, Brooklyn, and the New York State Library School, Albany. The newly appointed State Organizer has been made a member of the Committee on State Examination for Librarians, which will report at the Asheville conference of the American Library Association in May, 1907.

In the amendments secured to the constitution and by-laws of the Indiana Library Association, the Public Library Commission assumed a prominent part, its efforts being ably seconded by the progressive librarians of the State.

Since November 1, 1904, eleven librarians having had one or two years' courses at accredited library schools in the United States, have been appointed to library positions in Indiana. These, added to the eight mentioned in the last report, bring the total number of library school graduates in Indiana libraries to nineteen. The number of librarians or assistants in Indiana who have pursued one or more summer school courses for librarians in Indiana or elsewhere, has reached sixty-two. Many of the summer school students have taken advanced courses and several have entered library schools at Pratt Institute and Winona Technical Institute to complete one year's courses of study in library science. Individual instruction has been given in numerous libraries. Special instruction has also been given at the office of the Commission, or through correspondence, to meet the individual needs of the librarians of the State.

Since 1901 at least fifty-eight library buildings have been constructed in Indiana. Four of these were donated by citizens of the State, fifty-four were made possible by the gifts of Mr. Andrew Carnegie, amounting to \$1,108,000. The new library buildings erected in Indiana since 1904 number seventeen. Many of the plans of library buildings have been sent to the office of the Public Library Commission for criticism and suggestions.

Concerning the organization, reorganization and administration of seventy-three or more libraries, the Public Library Commission has given advice since the opening of its separate office in 1901. Such information represents visits to communities, personal interviews at the Commission office, addresses at various State, county or local meetings, and much correspondence. The opening wedges for future organization have been entered at many points. Such seed sowing can not show immediate result, but is necessary to secure advancement in one, two or even five years' time. Sometimes we build upon the seeming failures of past efforts for library establishment.

The traveling libraries now number 169, containing 5,807 volumes; the circulation has increased from eighty in 1901, 259 in 1904, to 716 during the past two years, when the boxes of books have been circulated 1,132 times, representing an estimated circulation of twenty-five thousand books based on the assumption that

each traveling library center is patronized by fifteen or twenty families, each family numbering four or five members.

The work with schools undertaken by the Public Library Commission was unfortunately curtailed by clerical error in the appropriation act passed by the General Assembly of 1905. Enough has been accomplished, however, to convince the Commission of the value of the work which, though carried on so successfully in other parts of the country, was comparatively new to the libraries and schools of Indiana. Some prejudices have to be overcome, some misunderstandings corrected before this department can be made to work to the best advantage of the people of the State. If to teach a child to read is clearly a duty of the State, to lead him from the grade school to the public library is as distinctly a duty. What a boy or girl does with the leisure afforded by hours after school, Saturdays and vacations, will determine his future as much, if not more, than the hours spent in the schoolroom. The enrichment of the school course, the inducements to deeper thinking afforded by formation of the reading habit, are plainly needed in a country which has developed too many shallow thinkers who have failed to become well-grounded in the principles of literature, science, history and sociology.

The lists of books and other printed matter distributed by the Public Library Commission of Indiana has increased greatly since the last report. The Indiana State Organizer had a part in securing at the 1905 conference of the American Library Association held at Portland, Oregon, the desirable co-operation of the Publication Board of the American Library Association, whereby the interest on the hundred thousand dollars contributed by Mr. Andrew Carnegie for bibliographical work for the smaller libraries was made available for buying lists of books which all State Commissions must use in their work. These current, annotated buying lists have been distributed free to the libraries of the State. Bulletins have also been sent, giving information regarding the expiration of copyrights on certain books and advice as to the purchase of books to the best advantage, so that unscrupulous book firms may not obtain advantage of the libraries removed from book centers and the income from taxes may be most wisely spent by the various book committees. The first numbers of Volume I

of the Library Occurrent were issued during 1906. This affords a medium of communication between the Commission, the local libraries whose interests it was created to serve, and also serves as an exchange with other Commissions. When all libraries become possessed of a common body of knowledge regarding best methods in library administration, the libraries of the State will go forward by leaps and bounds, and there is no better way of bringing this about than by printed lists and information.

ORGANIZATION.

What constitutes the duties of a State Organizer working under the direction and authority of the Public Library Commission of Indiana? In answer to the often repeated inquiry the following statement is given:

The duties of a State Organizer of Libraries are: First, the organization of the work of the office in such a manner that the Commission is ready at any time to give information concerning the libraries of Indiana. Second, to give to the trustees and librarians such information and advice as may be necessary to increase the efficiency of the libraries of the State. Third, to encourage the establishment of local libraries, to visit towns and cities and assist in the organization of libraries, giving necessary information regarding the provisions of the library law which have become familiar through constant organization under it, to impart that body of legal opinion rendered from time to time by the Attorney-General, to afford by numerous examples of like organization that encouragement which induces a community to forge ahead and establish a public library in the face of local opposition on the part of those less informed as to the library needs of the town or city. Fourth, to give the smaller towns, the unincorporated communities, the struggling libraries, and the students, whether in school, clubs or in homes who wish to pursue special courses of study, the books circulated in the traveling libraries. The Organizer attends as many State, county and township meetings as will bring him into personal contact with the farmers of the State. Fifth, to keep in closest touch with the educational interests of the State, that their advancement may be marked by increased efficiency, obtained through a wider use of books other than text-books; to aid in the establishment of township libraries

in places where the centralization of schools and the establishment of township high schools have been effected; to aid the club members in their study of literature, history, science and betterment of civic conditions. Sixth, to assist in the dedication of public libraries and by emphasis laid upon the relation of the library to the community, to encourage the citizens to maintain the library as a necessary educational institution. Seventh, to participate in the conduct of instruction to librarians through courses of summer school training, library institutes and instruction in local libraries. Eighth, by means of report blanks, correspondence and newspaper clippings, obtain as much information concerning library conditions as will enable the Commission to intelligently meet them. Ninth, to bring about such affiliation with local, State and national library associations that the work of each will be strengthened and Indiana assume its proper share in the world's library development.

Generally speaking, the above constitutes the duties of the State Organizer of Libraries acting as the executive officer of the Public Library Commission of Indiana. In a more restricted sense, organization is concerned chiefly with the establishment of local libraries.

ESTABLISHMENT OF LOCAL FREE PUBLIC LIBRARIES.

Local library organization is effected chiefly through the initiative of an individual or group of individuals who, impressed with the necessity of keeping intellectual and spiritual forces abreast of material prosperity, are certain to be confronted with people poor in ideals, though perhaps rich in property. To the credit of the latter let it be said, that they generally acquiesce in library organization when convinced of its desirability. No better method exists of enlisting the sympathy of all the people than calling a citizens' library meeting, inviting the State Organizer to be present, and affording opportunity for frank discussion from all present. As a result of such a meeting, the following resolution is generally introduced:

Resolved, That it is the sense of this meeting that a public library and reading room should be established in _____, and, therefore, that the chairman be authorized to appoint a committee of seven to take the necessary steps to secure the organization of a public library

and reading room under the library law of the State of Indiana, passed by the General Assembly in 1901 and amended in 1903, and that said committee be instructed to confer with the Public Library Commission as to the best method of securing such organization.

It is unwise to ask for any subscriptions at the meeting which is called for the purpose of discussing the desirability of the establishment of a library. Usually the Citizens' Library Committee confers with the State Organizer at the conclusion of the meeting. The town or city is divided into districts, if a popular subscription is to be raised, the committee using the printed subscription blanks furnished by the Public Library Commission. When pledges to the amount equal to two-tenths of a mill on each dollar of taxable property in the corporation are secured from fifty or more taxpayers, the Citizens' Library Committee files with the clerk of the circuit court the subscription papers thus obtained. After the judge of the circuit court, the town board or city council and the school board have appointed the Library Board of seven members, three of whom shall be women, and have notified them in writing of their appointments, the Library Board members take oath of office and proceed to organize by appointing a president, vice-president and secretary. No treasurer is required, as the city or town treasurer collects the library tax, which is kept separate from other taxes and paid out only upon the warrant signed by the president and secretary of the Library Board.

The first duty of the Library Board is to fix the amount of the tax levy and recommend it to the town board or city council, so that it may be included in the tax levy of the ensuing year. Out of courtesy to the town board or council, the recommendation should be reported at least a month in advance of the making of the annual tax budget. This recommendation, which can not exceed one mill on each dollar of taxable property, must be repeated each year by the Library Board. The levying of the tax so recommended is mandatory upon the town board or city council. The subscription papers previously filed with the clerk of the circuit court are placed in the hands of the Library Board, who proceed to collect the quarterly installments.

After the establishment of the public library is thus assured, the first duty of the Public Library Board is to appoint a competent librarian who has had training in modern library methods

and is thus prepared to render valuable assistance in the selection and arrangement of the room, shelving, furniture and books. Too often a library board select pretentious rooms, fit them up with costly furniture and then, when funds are running low, look around to find a cheap librarian, and it is not difficult to find one who, having failed in other avocations, thinks himself qualified to administer a public library. He must be regarded as a mere custodian of the library, not a purveyor of the best literature. If, however, the Library Board is wise, and Indiana can boast many such, it will determine the maximum salary it can afford to pay a librarian, realizing that he will make the most out of small resources, will render five hundred books worth to the library patrons more than five times their number of a poorly administered collection. The well equipped librarian understands working with teachers, pupils, editors, preachers, doctors, lawyers, artisans and business men so that the library becomes an influential center and its support is cheerfully assumed by the taxpaying citizens.

It is well to mark the opening of a public library with appropriate exercises. Civic pride is aroused and interest in the library fostered, as the people learn from addresses something regarding the importance of this beneficent institution which is a power for inestimable good in any community.

It is not enough to organize a public library. The Public Library Commission should be able to confer with each local library board and librarian at least once in two years, so that the library thus auspiciously organized may increase in efficiency as the years go by, having the benefit of the knowledge of library methods which have been approved and recommended by the State and national committees. Older established libraries must, of necessity, hold fast to much which pertains to their past, but if they become fixed in their methods, they are departing from the law of growth.

As far as practicable, technical processes throughout the State should be as nearly uniform as possible, so that the librarians and patrons may work to better advantage, since they understand the generally accepted library technicalities. With these adopted, the local librarian is left free to work out the local problems in the best possible manner, stamping upon their solution his individuality. While many of the local libraries organized under various

laws of the State present fair library conditions, the general effectiveness in library administration would be augmented if all library trustees would reorganize under the library law of 1901-3. (See page 112.)

Representatives of the Public Library Commission have visited the following places since the last report was issued: Auburn, Bedford, Carmel (2), Carthage (3), Crown Point (2), Danville, Delphi (3), Earl Park (3), Elkhart, Evansville (2), Fort Wayne (3), Fowler, Goshen (3), Greencastle, Jeffersonville, Kendallville (4), Knightstown (2), Kokomo (2), Laporte, Lebanon (2), Logansport (2), Ligonier (2), Lima, Martinsville (2), Monticello, Moores Hill, Mount Vernon (2), Muncie (3), Nashville, New Albany (2), New Harmony (3), Peru (2), Plainfield (3), Poseyville (2), Rensselaer (2), Richmond (3), South Bend, Spencer, Sullivan, Terre Haute (2), Tipton, Union City, Valparaiso, Vincennes (2), Warsaw (2), West Lafayette (3), Winona Lake, Winamac.

By the 1905 amendment to the law creating the Public Library Commission, "the Commission shall each year obtain reports of all libraries in the State, and on October 31, 1906, the Commission shall make a full report to the Governor as to the library conditions and progress in Indiana. This report when printed shall be presented to the General Assembly of the State of Indiana and biennially thereafter a like report shall be made."

In order to obtain authentic information necessary for the compilation of these reports, it is obvious that the libraries of the State must aid the Commission to the extent of filling out the report blanks furnished by the Commission. Many of the libraries have not only filled out these, but have sent also valuable narrative reports, thus enabling the Commission to better understand local conditions and render such State aid as may best advance these special library centers. The failure of some libraries to respond to any of the three requests sent them must, in most cases, account for the lack of late data and the necessity of including information taken from former reports.

SUMMER SCHOOL FOR LIBRARIANS.

On August 8, 1906, the Public Library Commission celebrated with appropriate exercises the fifth year of successful organized summer school training for librarians. Representatives of five classes were present and letters were received from many who could not attend but who wished to have a part in the interesting occasion. The reports verbal and written gave evidence that the summer school for librarians had been an important factor in the library development of the State, affording as it does, opportunity for librarians in position to absent themselves from their local libraries at a season when they can be best spared, and in the six weeks acquire, through the course of study, enough knowledge, suggestion and encouragement to enable them to give to their communities more intelligent service in the administration of tax-supported libraries.

May 15, 1902, marked the completion of the first course in the School for Librarians conducted by the Public Library Commission in Room 85, State House. The State Organizer was director of the school and was ably assisted by Miss Harriet L. Eaton, a graduate of Pratt Institute School of Library Training.

Suitable quarters were not obtainable at the State House, so the Public Library Commission gladly availed itself of the opportunity offered by the Winona Assembly and Summer Schools' Association to conduct an annual six weeks' course in the Summer School for Librarians at Winona Lake during July and August. Miss Merica Hoagland has been the dean of the school and Miss Anna R. Phelps, the head instructor. They will continue in the same capacity during the summer of 1907, acting under the direction of Mr. Chalmers Hadley, Secretary and State Organizer of the Public Library Commission. Assisting them have been the following: Miss Sabra W. Vought, New York State Library School; Miss Ida M. Mendenhall, Pratt Institute School of Library Training, and Miss Lillian B. Arnold, Illinois Library School. Special instruction and lectures have been given by librarians and speakers of note and experience. Chief among these have been: Miss Mary W. Plummer, Director Pratt Institute School of Library Training; Mr. John Cotton Dana, Librarian, Newark, N. J.; Mr. J. I. Wyer, Secretary American Library As-

sociation, Vice-Director New York State Library School; Miss Mary E. Ahern, and many others. Mrs. Elizabeth C. Earl and Mr. Jacob P. Dunn, members of the Public Library Commission, have addressed and inspected the school annually. The fourth quarterly meeting of the Public Library Commission has been held at Winona Lake on the first Tuesday of August.

ADMISSION.

The requirements for admission to the Indiana Summer School for Librarians conform to the standards adopted by the Committee on Library Training of the A. L. A. Only librarians in paid library positions or under appointment to them, and who have completed a four years' high school course or its equivalent, are admitted to the Summer School. Those who desire to enter the library field are recommended to enter the Winona Technical Institute Library School at Indianapolis, or one of the other library schools of the country, where in one or two years' time they may acquire in a more thorough manner the principles of library science.

COURSE OF STUDY.

Necessarily, the abbreviated course of instruction offered in any summer school course for librarians is elementary and suggestive. It leads earnest librarians to further study and effort, it encourages them in their use of approved methods, giving them more poise and confidence in the performance of their daily tasks. As progressive professional men and women are ever seeking to improve themselves by pursuing, at intervals, courses of study suited to their particular callings, the librarians recognize the necessity of seeking, through advanced courses of library science, that help which enables them to keep their libraries up to higher standards than would otherwise be possible.

The following subjects have been presented in the past two years at the Indiana Summer School for Librarians by those whose names appear below:

Merica Hoagland: State laws applied to local libraries, organization of public libraries, reorganization of established libraries, branch libraries, librarianship, library boards, library extension, library schools, library publicity, library buildings.

Anna R. Phelps: Instruction in book selecting, ordering, shelf listing, cataloging and loaning, note taking, accession, library handwriting, Government publications, binding, typewriting.

Lillian B. Arnold: Classification of books, general bibliographies, general reference work and practical library administration, book numbers.

Ida M. Mendenhall: Library work with schools, instructing the librarians how to encourage school children to use the library for home reading, school study, bulletin making, instruction in story telling.

Mr. Chalmers Hadley: Reference work; advanced bibliography.

Georgia H. Reynolds: Traveling libraries, reading courses for farmers' clubs, books for study clubs.

The Library Commission does not make a practice of recommending for vacant library positions in Indiana any but those who have creditably completed one or more years in regular library schools or who have supplemented a wide experience in library position by special courses of library training. Whenever possible, summer school students are urged to add to their summer instruction at least six months' study in a regular library school. It is only by deepening the library knowledge gained in summer school instruction that librarians can hope to attain their best goal.

The following excerpts from letters received from former summer school students on the reunion day last August, show the value they received from their instruction there and gave interesting information as to what some of them have been doing since.

From Washington, the following was received:

Since I can not be with you, I gladly send greetings to the class of 1906, with the wish that each member may take home with her the broadened horizon and clearer view of her work that I did.

The first two years of my library life were like groping in the dark, but since the term at Winona, and with close application to study since, I have been able to classify and catalog more than one thousand books; have prepared a title and author list of nearly five thousand, besides routine work and special attention to the children. The teachers are gradually drawing closer to the library, several of them having been in lately looking over our material and making lists for the coming school year. The clubs of the city are in close touch with us, one consulting us as their program is made out. We have reason to be gratified with the work accomplished.

One of the most interesting letters read at the summer school was from the librarian at Huntington, who wrote in part:

After completing my course at Indianapolis in 1902 my work as assistant librarian was continued, with much more enjoyment and insight than heretofore. Three years ago last February we moved into our beautiful new Carnegie building. With the help of an assistant I dusted each one of our ten thousand volumes before it was taken over to the new home. This sounds an immense undertaking, but while it was a labor of dirt it was also a labor of love, and we found in this way many books were brought to our notice that we did not remember having. The librarians who live in a little cramped storeroom can sympathize with us, and can understand why tears came to our eyes as we looked around our cheery, clean and inspiring little building on February 19, prior to the opening, that evening, to the citizens of our town. A fair per cent. of these citizens take advantage of our institution.

With the High School students we do work that is very satisfactory to us, and a great help as well as a pleasure. We find that by making an effort to hold the boy or girl while in school we are very apt to keep a hold on him or her when school work is over.

During the summer months I have the programs of eight or ten literary clubs at my desk, and take many a trip abroad in looking up references for the various club members. * * *

I find our business university here a great help in getting out typewritten lists for me. This they do free of charge, as they are glad to have material to practice on.

Last year I sent typewritten lists to the first five grades in each of our six school buildings. One month a list of all the bird books in our library, the next month animal books, one month Thanksgiving stories, and one month Christmas stories, etc.

Last December we put red canvas covers on every book that had a Christmas story in it. These red covered books we put in a revolving bookcase near the entrance to the children's room, and it greatly increased our Christmas reading.

In February, with the help of a boy who was interested in his manual training, I made an Abraham Lincoln log cabin, and put it on exhibition in the children's room for ten days before Lincoln's birthday.

The directions for making this cabin may be found in one of the Beard handy books.

It was made from limbs, or twigs, rather, and glued to a board 2x2½ feet, and moss laid on the boards around the cabin, to look like grass. The chimney was made of matches and then puttied. Nothing we have ever attempted pleased the children so much.

This spring we had an exhibition of old books—including a number belonging to the library, and about forty from interested citizens. This exhibition brought us several old editions as gifts.

Two years ago this coming November our librarian resigned, and I was appointed to succeed her. During this time I have had but one assistant until a few months ago our library committee relieved me of desk work and made me reference librarian and cataloger. Our library

is open from 9 in the morning until 9 at night, and we have two girls at the desk. We are now using the Library of Congress cards for cataloging and are much pleased with them. During my service as librarian the past two years we have added 2,090 volumes to our shelves, and have issued 2,796 cards to readers. Our circulation has increased from 25,160 to 32,828. The circulation has increased nearly 2,000 in two years' time. At present we are spending more money for new shelving, etc., than for new books.

Since January we have been trying the experiment of Sunday afternoon opening. The first few Sundays we averaged 100 readers. But now, during the warm days, we have hardly twenty-five. The heaviest burden I have at present is a vaudeville, just around the corner, and it takes my small boys every night in the week. Can any fellow librarian tell me how to start a counter-attraction?

An illustration of library zeal and a missionary spirit were shown in a letter from Miss Mary Pratt of Indiana, a former student, now residing in Louisville, Ky., who wrote among other things:

Since attending your school in Indianapolis my interest in library work has increased, though my experience has been limited.

The little library I fostered for nearly four years in one corner of a street car barn, without any support other than that from voluntary contributions and entertainments, was presented to the city as soon as a public library began to take definite shape. The gift, which consisted of 2,100 volumes, a card catalog and five bookcases (the latter a varied assortment purchased at second-hand stores), was immediately accepted, and in January, 1905, a vacant store was rented, fitted up nicely at a cost of about \$500, and our few belongings were moved across the street by some High School boys. A salary and an assistant (with a salary, too) was given, and the work has been growing steadily ever since.

The branch was in operation five months before the Central Library was started on its way.

This spring some of the friends of the little institution contributed \$4,000 for a beautiful lot just a square from our present quarters, and the plans are now ready for a building which will cost about \$30,000. Mr. Carnegie has promised \$200,000 for buildings for eight branches, and this will be the first erected.

The primary aim of the summer school has been to increase the efficiency of Indiana libraries, and the following extract in a letter from New Albany shows that this efficiency was appreciated by the Library Board:

Am busy with preparations for the fall and winter. Would it interest you to know the Library Board at its last meeting set its approval on my work in a substantial manner by increasing my salary \$10 per

month? I tell you this because I think the training I received at the Library School was a large factor in any success I may have had.

A Toledo, Ohio, student wrote in the same strain.

Without exception the letters received showed appreciation of the instruction received at the summer school and its value when applied to actual work in a library. The following were extracts from characteristic letters received and read at the reunion:

Bedford:

It is with great regret I write to decline the invitation to meet with the faculty and classes of the Summer School for Librarians which meets at Winona on the 8th.

I can only hope this' class' of 1906 will get the wonderful help and enthusiasm which the class of 1903 received.

I am using daily the knowledge gotten from my work with you, Miss Hoagland, and from Miss Phelps, and find it has made my work in my own library broader, and I hope much better than before.

With best wishes for the continued success of the school, I beg to be called its staunch friend.

Salem:

If not there in person I can assure you my heart is with you, and I often think of the many hot hours I spent in that little room trying to overcome some of a librarian's difficulties. Although the heat was great, the benefit derived was far greater. Since attending library school I have enjoyed my work more and it has enabled me to be of greater service to the public. Before attending school I thought there wasn't very much work to be done by a librarian, but I had not been there very long until I began to realize that her 'idle moments were few, indeed.

I hope the day will prove an exceedingly pleasant one and one to be long remembered.

Bluffton:

I only knew today that it would be impossible for me to meet with you and I am sure that you know how great my disappointment is to me.

I can not tell you how much the six weeks' work did for me—it is impossible to tell. My time is too short to do half the things that you showed us how to do and gave us the inspiration to do. But I am so proud of our library and all that it means to our little city.

I have done as you advised me—first of all I accessioned the library—all this has been done at odd moments when not in the active library work—then turned to book numbers and shelf list, and am getting all done as fast as I can.

I have found the bulletin work a wonderful help and delight to both the teachers and children and the one thing that has been especially inspiring has been the visits made to the library by the children in company with the teachers.

We have been very fortunate in having given to us a wonderful collection of bird eggs and as you can immediately guess that this is a great attraction to the old as well as the young.

Chicago, Ill.:

I sincerely regret being unable to accept your kind invitation to meet with you during the reunion days of your School for Librarians, for I not only received much profit there, but also much pleasure. The members of the school can speak with certainty of its worth and it is a pleasure to voice one's gratitude for it.

INSTITUTES.

On account of lack of funds, the Public Library Commission of Indiana has been obliged to discontinue the library institutes so successfully begun in 1903. By means of a library institute it is possible to arouse public sentiment in favor of establishing free public libraries, new traveling library centers, and to awaken interest in increasing the efficiency of those already established. In the library institute, some librarians whose meagre salaries do not admit of their attending even summer schools for librarians, may come into intelligent touch with library methods and lose that sense of isolation which often casts its blighting influence on attempts to improve present library conditions.

Trained librarians or those long in service in their communities may find in the library institute opportunity to compare methods and experiences and to afford the librarians of the smaller libraries the benefit of much valuable discussion. It is not by the few better equipped librarians in the larger towns and cities in the State that the library progress is to be measured; it is only by affording all the libraries an equal opportunity to improve their conditions that the level of library conditions is raised, and there is no better way of beginning this than in the Library Institute.

TRAVELING LIBRARIES.

Aside from the efforts put forth by the Public Library Commission of Indiana in organizing and reorganizing free public libraries, in lending assistance to the local board and librarian wherever possible, in furnishing book lists, in showing plans and giving aid through personal visits, there is no greater feature of educational work than the Traveling Libraries.

A large proportion of the citizens of our States live outside of the cities, and owing to the distances existing they are deprived of the advantages so free to those living in close proximity to the public libraries and schools. Placing books into the isolated communities and farm homes is a part of the extension system carried on by about thirty-two States in the Union.

New York was the first to send out Traveling Libraries. It was followed by Michigan, Iowa, Ohio, Minnesota, Nebraska, Maine, Wisconsin, Kansas and others, all making State appropriations. In 1899, through the efforts of the Indiana Union of Literary Clubs, the Public Library Commission was created, and the first appropriation was made by the Legislature to send out the Traveling Libraries. In August of that year thirty-four libraries were ready for distribution. Twenty of these were collections containing forty books made up of fiction, nonfiction and juvenile books suitable for localities with no library privileges and for farm homes. The remaining thirteen were on specific subjects of general interest designed for study clubs and schools. These contained from fourteen to seventeen books. In January, 1900, twenty-four more libraries were added; these, with twenty added the following October, made eighty libraries containing 2,581 volumes. The records show that during 1901 there were fifty associations in the State using the libraries and twenty-four new associations were added in 1902. From the organization of the Public Library Commission to October 31, 1900, library associations were formed in thirty-nine of the ninety-two counties of the State. There were sixty-nine organizations, and they had received 107 libraries. The results were such that in 1901 the Legislature increased the appropriation for the Commission's clerical expenses from \$500 to \$1,000. From October 31, 1900, to November 1, 1901, eighty-seven libraries were circulated, and from October 31, 1901, to November 1, 1902, seventy-two libraries were loaned. The first of November, 1902, the administration of the eighty libraries was turned over to the Public Library Commission office. At that time there were seventy-four associations in fifty-two counties, and 184 libraries had been sent out. An immediate effort was put forth to have the people over the State know of these books, so circular letters were sent to the editors of 300 newspapers of Indiana, briefly stating what the libraries were

and how they could be procured. The State Organizer and Traveling Librarian were invited to many of the county farmers' institutes held under the auspices of Purdue University, also teachers' institutes, home economic organizations, etc. In this way the existence of the Traveling Libraries became known and many letters were received asking for information. The following winter the department was unable to supply the demand. Forty letters were received from the readers of one agricultural paper, the *Indiana Farmer*. Seventeen new libraries were added, making ninety-seven libraries in circulation. From October 31, 1902, to November 1, 1903, 209 new centers were added and 228 libraries were loaned. The following year 245 libraries were loaned to the associations over the State, many of them remaining in single localities for six months. November 1, 1903, the number of counties having libraries had increased from fifty-two to seventy-five, with a total of 198 library associations. One hundred and twenty-seven libraries were in circulation; of that number thirty-six were designed especially for the study clubs and schools. During the twenty months after February, 1902, twenty-one libraries were made ready for circulation. Each one was made up as needed. These have been sent to 204 communities. Of this number three were on special subjects. The remainder were for general circulation. A request came to the Commission for some special books on agriculture for a locality where there were several young farmers. Ten good readable books relating to the subject in its various phases were placed with a collection of thirty books of general character. The library is always in use, and since that time ten of like character have been made up. The circulation, however, of these books proves that the farmer is quite ready to lay aside the subject occupying so much of his time and to interest himself in the questions of the day and in books that others are reading. The twenty-one libraries have visited 204 communities.

There are now about three hundred traveling library associations in the State. All but two of the ninety-two counties have organizations. Some of the counties have five and six associations. The average association consists of from fifteen to twenty families. Averaging five persons to the family in the three hundred associations, about 25,000 people are thus interested in the books. The Commission furnishes twenty-five towns of less than

Traveling Library Station in the Country, Fourteen Miles From a Public Library.

100 inhabitants with libraries. Of these one had nine libraries, or 360 books; another fourteen libraries, or 660 books.

These boxes of books have cost seventy-five cents each for transportation. There are 114 associations in towns of less than 500 population and forty-two associations with populations varying from 500 to 1,000. The Commission furnishes about fifty country schools with libraries.

From November, 1903, to November, 1904, fifteen libraries were made up. There were demands and requests for help from study clubs over the State and thirteen of the libraries were for their use. These have visited seventy-four clubs in seventy-four different communities.

In the past two years fifty-one libraries have been made up; twenty-four of them for study clubs, eight of the number solely for use in the schools; five containing agricultural books and three on domestic science. The Commission has at present 170 traveling libraries containing 5,825 books. The libraries have circulated 1,132 times. There have been 211 new associations formed in the past two years. During that time 716 libraries have traveled over the State. The records often show a circulation of two and three hundred during the time the library remained in the locality. Much depends on the librarian whether he be interested in the books himself and exerts himself to circulate them and to arouse interest in the locality. The traveling libraries fill a demand, and the books are for the most part well read and carefully handled. A request came from a certain locality in the State for a few copies of the *Youth's Companion* to be included in the library to give to the children of that section who had never owned a book. In another locality the members of the association are fourteen miles from a library. They are regular patrons of the Traveling Libraries and enthusiastic in their selection and interest. Many letters are received from isolated districts expressing thankfulness for the books.

A person living outside of a town of 211 inhabitants wrote for information concerning the traveling libraries and added: "This community is badly in need of some kind of reading. Here in the country the evenings are so long, the daily and weekly papers do not wholly occupy all the spare moments till bedtime. As we

Millinery Store, a Traveling Library Station, in a Town of 1,610 Population.

can not have access to the city libraries we are trying to obtain a circulating library."

In another farming locality the local librarian was so pleased with the books and anxious to have all in the locality interested in them, that he would carry to one of his neighbors a certain book likely to be helpful or entertaining to him, or take it to the village postoffice and leave it to be called for.

In another small town of less than 500 inhabitants an energetic woman opened a reading-room in her own home, which she made attractive with a big table, large lamp, several chairs, and with two of the traveling libraries set up, invited the boys of the town to look over the lists and handle the books, in which they quickly became interested. The parents were included, and the books loaned out, new members taken in and the reading-room made a feature of the town. Eight libraries or 320 books have been sent to the locality.

The records show that in the majority of the associations the children's books are read as much by the parents as by the children themselves. The teachers of the country schools are especially enthusiastic over the traveling libraries. In some places they have small collections of old, unused, wornout books. In other instances, none at all. To such the traveling library is a veritable boon.

The method of loaning the books is much the same in all of the States. In Indiana the signature of five persons is required, two of whom must be taxpayers. The only expense connected with the books is the prepaid round trip express rate, which varies from 60 cents to \$2.00. The books are loaned for three months and may be retained for another three. They are sent to town and country schools, Sunday schools, reading-rooms, small libraries, lodges, granges, country clubs, study clubs and into farm homes. Indiana being largely an agricultural State, the greater proportion of its libraries go directly into farm homes. The books are placed in postoffices, stores, express offices, lodge rooms, halls, churches and houses.

The prospects for increased circulation during this season are very encouraging. Efforts will be made to have many of the old

associations which have lapsed, reorganized; also to get books into the mining districts where there are none, and parts of the States where there are few associations.

WHERE TRAVELING LIBRARIES HAVE BEEN SENT.

The following places have had traveling libraries: Advance (9), Albion (2), Andersonville, Atlanta, Attica (3), Austin, Avon, Bean Blossom, Bedford, Bennington, Berne, Bicknell, Bloomingdale (4), Bloomington (rural), Boonville (2), Bourbon (5), Bowling Green, Bridgeport, Brook, Brookville, Brownstown, Burnett, Burnetts Creek, Butler (2), Butlerville, Cambridge City (5), Carlisle, Carmel (3), Carpentersville, Carthage, Chesterton, Chesterville, Chrisney, Clay City, Clayton (5), Clifty, Clinton, Cloverdale (3), Colfax, Columbia City, Columbus, Connersville (8), Converse (2), Corydon (4), Cottage Grove, Covington, Crawfordsville, Crown Point (2), Cuba, Dale, Dana (2), Danville (4), Decatur, Delphi, Denver, DeSoto, Dillsboro, Duncan, Dunkirk, Earl Park (3), Economy, Eden, Elberfield, Elkhart (2), Emmerichsville, Evansville (6), Everton, Fairfield, Fairmount (2), Farmersburg, Flat Rock, Flora, Florida, Fort Wayne (3 rural), Fountain City (3), Fowler, Francesville, Frankfort, Franklin (2), Frankton, Freedom, Freelandville, Fremont (2), French Lick, Galveston, Gaston, Gatchel, Gosport, Greencastle, Greenfield (2), Greentown, Greenwood (3), Guilford, Hadley, Hagerstown (5), Hartford City, Hazelrigg, Holton, Hope, Hometown, Huntingburg, Huntington (rural), Indianapolis (4), Jamestown (2), Jasonville (2), Jessup, Jonesboro (2), Kendallville, Kewanee (3), Kirklin, Knightstown (2), Knox, Kokomo (2 rural), Ladoga (3), Lafayette (3 rural), Lafontaine, Lagrange, Lanesville, Laporte, Lawrenceburg (2), Leavenworth, Lebanon (6), LeRoy, Liberty, Ligonier, Lilly Dale, Lima, Linton, Lizton (2), Loogootee, Losantville, Lowell (4), Lynnville, McGregor, Macy, Madison (6), Marion, Marshall, Marshfield, Martinsville, Maxwell, Mays, Miami, Michigan City, Milan, Milton, Moran (2), Morgantown (2), Monrovia (4), Monroeville (2), Montezuma (2), Monticello (2), Mooney (2), Moores Hill (3), Mooresville (3), Mount Carmel, Muncie (2), Nashville (3), Nebraska, Needham, Needmore, New Albany (2), New Amsterdam, New Carlisle, New Castle (2), New Market (2), New Richmond, North Judson

(2), Norristown (2), North Manchester, North Vernon (4); Oakford, Oakland City, Ontario, Onward, Orleans, Owensville, Paoli (9), Paragon (2), Parker, Patoka, Patriot, Pekin, Pendleton (6), Philomath, Pimento, Pittsboro (3), Plainfield (3), Pleasant Mills, Plummer, Prairie Creek, Princeton, Providence, Pulaski, Reelsville, Rensselaer (3), Richmond, Riverdale, Roann, Rochester (3), Rockport, Rockville, Rome, Rosedale (2), Ross, Rushville, Salem (4), Sandborn, Saxony, Scottsburg, Selma (2), Seymour (2), Sharpsville (2), Shelburn, Shelbyville (2), Sheridan (2), Southport, Spartanburg (2), Spencer (5), Springport, St. Croix, St. Joe Station, Star City (3), Stendal, Stewartsville, Stilesville, Stockwell, Stone Bluff, Stonington, Sullivan, Summitville (2), Swayzee, Tell City, Terre Haute (3 rural), Throntown, Tipton (4), Tobinsport (2), Trafalgar, Twin Lakes, Union City (3), Vallonia, Valparaiso (2), Vawter Park, Velpen, Versailles (3), Vevay, Vincennes (2), Wabash, Wagoner (2), Washington, Waterloo, Westfield (2), West Lebanon (2), Wheatfield, Whitcomb, Whitestown (2), Williams, Winamac, Winona Lake, Wolcottville (2), Wood.

LIBRARY WORK WITH CHILDREN.

Fraught with immense possibilities is the library work with children. The Public Library Commission realizes that great as is the opportunity afforded by any public library for interesting adults in better reading, by far the greater work lies with the children, the boys and girls who leave our grade schools and enter our stores, factories and other gainful occupations. The more likely it is that a boy will tend a machine, the more necessary it is that he be given such education and uplift that he becomes the better man because, having acquired a reading knowledge, he has also gained through the public library that reading habit which enriches and safeguards life. To lessen the hours of labor without educating boys and girls to intelligently employ their leisure hours with wholesome reading and recreation, so that when they enter the ranks of wage-earners they are driven into excesses and crime, is to place into the hands of the coming citizens, weapons which are too certain to maim if not to destroy them. We are slow to act on the gospel of prevention promulgated by Sir Thomas More, over four hundred years ago. Students of sociology, settlement

workers, State charities' organizations, and superintendents of reformatories are joining the librarians in urging a wider use of the public libraries.

In better homes, where the use of books is emphasized by educated parents, there is little need of urging the necessity for close co-operation between the school and library, but in a republic each child should have the opportunity in a homelike library to acquire the same reading habit which comes to the boys and girls in well-to-do homes.

There is danger, however, that sentiment may carry us too far in considering library work with children. The library may, and wisely does, introduce kindergarten methods to interest children. It may also seek to entertain the boys and girls who might otherwise be led into mischief and into crime. The public library, through its children's room and intelligent children's librarian, should so direct the reading of the pupils in the public school that the geography, literature, history or science lesson will assume an interest that will naturally lead to books and wider knowledge which are in themselves safeguards of youth.

To do this work effectively, teachers as well as librarians must be more widely familiar with the books to be placed in the hands of their pupils. It is impossible for the busy teacher to acquire much of this knowledge of children's books after he has become a teacher, so that it is clear he must during the normal school course become familiar with library work with children. This does not mean that those who graduate from the normal school shall have learned technical library processes as taught in library schools. It does mean, however, that they shall acquire some knowledge of methods of interesting children in the books to be found in the average public library.

As stated in the last report, the Indiana Commission was the first to attempt centralization of library work with schools. Miss Ida M. Mendenhall was put in charge of the work.

From the *Educator-Journal* we quote the following account of this important phase of Library Commission work:

In September, 1904, Mrs. Elizabeth C. Earl, Mr. Jacob P. Dunn, and Mr. William W. Parsons, members of the Public Library Commission of Indiana, began to work systematically to bring about closer library and school co-operation, seeking through addresses and conferences to enlist

the interest of librarians, teachers, superintendents, school trustees, members of library boards and study clubs, and through publications and the press to create a healthy public sentiment favoring library work with schools.

To prosecute this work the Public Library Commission selected Miss Ida M. Mendenhall, who possesses peculiar fitness and ability.

The instruction given at the 1904 Summer School for Librarians at Winona Lake was followed by addresses in library institutes, State meetings of study clubs, school superintendents, and librarians and the publication of a list of books on birds arranged chronologically with reference to their appearance in Indiana. Beginning with January, 1905, the Commission afforded Miss Mendenhall time and facilities for preparing a course of instruction to be given in the normal schools in best methods of securing library and school co-operation.

Two years ago the Library Commission sought to arouse the interest of the normal schools of Indiana in this matter, but met with little response. With faith in the ultimate success of the work, in the face of some objection on the part of those actuated by personal or political motives, the Commission succeeded in introducing the course in the normal schools at Terre Haute, Valparaiso, Danville, and Earlham College, Richmond.

The course is not intended to teach library science or the technical processes of public library administration, but is designed to give the grade teachers who are to be, assistance in the selection of books to be recommended to their pupils for home reading and study. What boys and girls read for amusement or recreation often has more effect on their characters than all the textbooks which they peruse, so that in addition to the books which supplement studies those which interest and enliven are considered in their relative importance.

Mr. Mord. C. Carter, President of the Library Board of the Danville Public Library, says: "Miss Ida M. Mendenhall's visit and work at this place has resulted in a marked increase of interest in the work of the local library, and especially in the work with children and the selection of suitable books for them. It is the intention of the board to arrange better facilities for children's work."

President H. B. Brown, of the Northern Indiana Normal College, expresses himself regarding the course as follows: "The lectures were of infinite value to our students. Each subject was presented in such an attractive way that every student understood what was being said and understood its purpose, so that great and lasting good has been accomplished. * * * I believe the work to be of such value that it must at an early date become a part of the course in our public schools. Libraries are being established in many communities, and young people must know something about them, and the advantages of such information as Miss Mendenhall gives is what is needed to start them reading, and give them the right instruction as to what they should read."

At the earnest request of Prof. Harlow Lindley, Librarian and Professor of History at Earlham College, upon the invitation of President R. L. Kelly, the Commission gave the lectures as part of Dr. Edwin D. Starbuck's course in pedagogy. Earlham College afforded the best condi-

tions for giving the course. Prof. Lindley had made a thorough preparation, so that, though the course was elective, the twenty-five students who pursued it were given credit for the work performed.

Dr. Starbuck, commenting on the course given at Earlham, says: "I should like to have such work given for not only those who are preparing for teaching as a profession, but for the benefit of all of our students in teaching them the use of the library and of books. I wish the demand were made strong enough and your equipment sufficient to extend the course beyond the mere ten lectures, and have it given in each one of the institutions each year."

Prof. Lindley says: "This work is of the greatest importance; it is very practical and of a nature to extend its influence in a way which can not be measured. If the teachers, parents and librarians in communities were in a position to gradually instill this knowledge into the minds of the children, think what an influence this would have upon the children themselves as they were growing up, and it would add organic life to the library. This can only be accomplished by making the work permanent, and offering the instruction year after year until the lesson is well learned."

President W. W. Parsons, of the Indiana State Normal School, a member of the Public Library Commission, who, since the matter was first broached in the Commission meeting of August, 1904, has been greatly interested in this department of Commission work, expresses himself as well satisfied with the presentation of the course at the State Normal.

The course has attracted widespread interest and the outline of it given below has been sent upon request all over the United States.

OUTLINE OF NORMAL SCHOOL COURSE.

- I. Co-operation between the library and school.
 - History of the movement.
 - Work for schools in typical libraries.
- II. Reading of children.
 - Investigation of teachers and librarians.
 - Importance of directing choice in reading.
- III. Principles of selection in children's books.
 - Picture books.
 - Fiction.
 - Mythology.
 - Nature books.
 - History.
- IV. Reading lists helpful in selection of children's books.
- V. Picture bulletins.
 - Purpose and use.
 - Principles of making.
- VI. Reference.

With the failure of the appropriation to carry this work, the department was discontinued. Miss Mendenhall has recently accepted the position in the normal school at Genesee, N. Y., as Librarian and instructor in methods of interesting children in the use of books.

The Library Commission hopes to secure the re-establishment of library work with children.

ADDITIONAL INFORMATION.

To the above report is added a list of the Commission publications, rules and regulations for public libraries suggested by the Public Library Commission; narrative report concerning Indiana libraries, including libraries aided by the Public Library Commission and those which have special features of interest in their work; information concerning library buildings; law of the Public Library Commission passed in 1899, amended in 1903 and 1905; Indiana library law passed in 1901, amended in 1903; important decisions rendered by the Attorney-General regarding the Indiana library law; maps showing the location of traveling libraries in the years 1901, 1904 and 1906; another map showing the location of free public and institutional libraries in Indiana; chronological statement concerning a century of library development in Indiana; statistical table giving the resources and other information concerning Indiana libraries.

This is the first opportunity which the Commission has had of making a comparative report. The information available concerning Indiana libraries when the Commission was created was very vague. It was not until the Commission office was opened in 1901 that the libraries rendered any itemized regular report as to the details of their administration. The report prepared by the Commission in 1902 was not published, as there was no provision made for such a report. Under the amendments to the Commission law the report was ordered published by the State Bureau of Public Printing. The report herewith submitted, therefore, contains interesting data which furnishes the Commission information upon which to base its plans for the future development of work. It is worthy of note that the Public Library Commission has thus far proceeded on carefully considered lines of action and in conse-

quence has won the approval of the people of the State, who have expressed it in a substantial manner through the majority of their representatives in successive General Assemblies. The record is a creditable one and gives promise of greater library development in Indiana, which is earnestly desired by the progressive people of the State.

Respectfully submitted,

MERICA HOAGLAND,

Secretary and State Organizer, 1901-6.

LIBRARY BUILDINGS.

One of the most important lines of work in which the Public Library Commission has been engaged in the last two years has been that of advising communities as to the best plans for library buildings; buildings which combine usefulness and convenience for serving the public with attractiveness and architectural beauty. In no way can the growth of library development in Indiana be more strikingly seen than in the great increase in number and attention to beauty of library buildings which have been erected.

Until a few years ago almost any old residence which had outlived its usefulness as such, could be converted into a public library without attracting more than passing notice from the community. If a new library building were erected, it was frequently considered proper to leave the entire construction and furnishing, with the possible exception of the Library Board's room, to the discretion of the architect, or the personal whim or individual judgment of the librarian, who was in many instances possessed of small experience in library construction. Residences and store buildings are still converted into libraries in this State, but it is usually after communication with the Public Library Commission, whose wide observation and careful study of buildings, which an individual librarian ordinarily could not have, has been able to save numerous structures for successful library use, which otherwise would have been inconvenient, unattractive old shells. Through advice from the Commission, many small communities today are able to put their financial income into books and library service, instead of having to apply their funds in correcting mistakes made in converting old buildings or rooms into libraries.

It is through the munificence of Andrew Carnegie, whose money has been used in the erection of more than fifty libraries in this State, that the greatest object lesson in library development and expansion in Indiana is seen. Towns in all parts of the Commonwealth have been recipients of his gifts, and the effect on library work over the State has been pronounced.

Without entering into a discussion of the effect on communities through the wider diffusion of knowledge because of increased book distribution from so many libraries, the mere erection of so large a number of buildings must play an important part in the lives of communities. Usually the best plot available is given for a library site. It is frequently on the public square, sometimes it is placed at the intersection of the two principal streets, but wherever the site, if nearly always represents the focal point in the eye of the community.

In days past, the square-towered brick church with stained glass windows, from stock designs, was the architectural pride of the town, and many residences with abbreviated towers and colored glass in the entrance are still to be found as a result. The court house or jail was regarded as the highest development of building in county seats, but in the large majority of towns, the public library, representing as it does intelligence, education and culture, has supplanted the seats of justice and legal punishment.

In some cities the library building is one of several attractive structures, but frequently all of the beauty in the place seems crystallized in one building, and that is the public library. There is no doubt but that such a building exerts a constant and powerful influence over these towns architecturally, and even on the tastes and lives of the people. A few years ago a leading periodical emphasized the importance of beautifying the sleeping cars. It called attention to the over elaborate carvings, senseless arrangement of rope portieres and ridiculous profusion of mirrors in the cars and stated that many Americans reproduced these vagaries in their homes. How many more people are familiar with the interior of libraries than of sleeping cars, and the influence of library buildings, therefore, must be correspondingly greater.

The Library Commission has realized the importance of the library building to the community, and besides doing much to help secure economical, usable and convenient buildings, it has stood for the restraint, dignity, quiet beauty and the eternal fitness of things which are as desirable architecturally as in private character.

Whenever a new library is projected, the Public Library Commission, through its executive force, offers help and advice as to methods of organization, selection of building site and plans for

the library building. Many library boards and building committees have been saved from serious mistakes through the Commission, but the ideal library building has yet to be erected, and numerous Indiana libraries show the result of having left their construction entirely to inexperienced building committees or to architects whose aim primarily was for impression.

It is only the architect unaccustomed to planning library buildings who resents any interference or advice from librarians. Architects who have had experience in such work welcome suggestions when rightly given, for library construction presents problems which no other class of buildings does.

There are some rules for library construction upon which all librarians agree, and briefly summarized they are as follows:

A library building should be planned for library work.

The interior arrangement should be planned before the exterior is considered.

No convenience of arrangement should ever be sacrificed for mere architectural effect.

A library should be planned with a view to economical administration.

Anything which serves the purpose well for which it was designed is beautiful, and if a library building did nothing more than house the books conveniently and the readers comfortably, it would be a success. If the librarian, building committee or Public Library Commission were heeded on the question of library utility and convenience, most architects could be safely left with the decoration and external appearance of the building.

So ambitious are some communities to possess a show building in their library, that they become chained to their possession, and by extravagance in construction are prevented from having a library of great use and service. Utility and convenience for library work should be the slogan of all library building committees.

A striking example of a mistaken notion regarding library construction has been furnished in a city not in Indiana. A wealthy woman wished to erect a library as a memorial to a relative, and spared neither money nor effort in securing what she desired. Architects, interior decorators and mural painters were employed, but instead of an efficient library, she secured a mausoleum.

A bust of the donor's relative was placed in the library rotunda, and when the card catalog outgrew its cramped corner the librarian unwittingly encroached on the bust's domain and the catalog case had to be removed from the rotunda. The children's room was beautifully decorated with wall panels and figures about the fireplace depicting scenes from childhood, but as these could not be removed, the librarian had no alternative but to keep the children in this room, which was woefully overcrowded.

Quite a large sum of money was set aside by the donor, the income of which kept a small plot and fountain in the rear of the library in perfect condition. This expenditure exceeded the combined salaries of the librarian and assistants, it is said, who were required to serve the public as well as a purely ornamental building would permit.

No such flagrant example of the sacrifice of library efficiency to library decoration occurs in Indiana, but many mistakes have been made that should have been avoided. It is by calling attention to them and explaining why they are mistakes that their repetition may be prevented.

One Indiana library, admirable in many respects, has a high dome over the delivery room. The wall is encircled by a gallery which is reached by a stairway. The cost of this seems more than it is worth. There is nothing to be seen from the gallery that is not visible from the floor, and as heated air rises, it is more difficult to keep the delivery room warm in cold weather.

Another library building of stone, which gives a pleasing architectural effect externally, has a reference room too small to accomplish the best results, but this and all reading rooms are provided with highly polished mahogany shelves. Many library economists would consider both the stone walls and mahogany shelves as extravagant as compared to the money available for the purchase of books and librarians' salaries. The mahogany shelves show dust and scratches, and to many eyes are not as pleasing as less expensive stained or fumed oak shelves would be. This library, like others in Indiana, has a marble topped delivery desk, and unless blotters or some other protective material is put down, the desk assistants are kept shivering from its chilling contact except in the warmest weather.

Unless the community can afford really good wall decorating it

should content itself with solid colors of a pleasing shade and plain decorative bands. Do not try for a Congressional Library effect in a \$25,000 library building. Protect the library walls from the town sign painter if a vigilance committee has to be organized to do so. Mural paintings are beautiful if well done, but if not, they are an abomination. A few unfortunate libraries possess veritable chambers of horrors in entrance vestibule or delivery room, and the suffering they inflict on the discerning and sensitive is considerable. A common mistake library boards have permitted decorators to make has been to place on the walls or ceilings twisted looking cupids or festoons of roses such as are sometimes seen in barber shops or second-rate hotels. If really excellent work can not be afforded, the library should not attempt any decoration other than tinted walls and plain bands.

Attention is called to some mistakes in library construction and decoration as noted by the Library Commission in its work over Indiana, and while some of them do not seriously interfere with the library's efficiency, the mistakes should not be repeated in proposed new library buildings. Some of the mistakes suggest the following cautions:

Have as few partitions as possible, especially in a small library. Unless the library does much departmental work partitions are unnecessary; they give a cramped appearance to the library interior, interfere with the light, and prevent effective supervision when the library staff is small.

Do not have the windows so high that the books beneath are in a heavy shadow, and that give a prison-like effect to the library exterior. Have them sufficiently high, however, to prevent their being used as mere points of observation for persons seated in the library. Do away with all draperies and stained glass designs that decrease the light in reading and work rooms.

Avoid any plan in a small library which places the stack room on a different level from that of the delivery room. The constant stepping up and down by attendants is exhausting and the book truck can not be used to advantage. Have the ceiling in the stack room high enough to allow the construction of a second story of book shelves, if necessary.

Do not depend on ceiling lights for reading at night. Table

lights are better, and the unrelieved glare of lights from ceilings is trying to many eyes.

Avoid cement floors on the main and second floors. They are noisy and cold. If used in the basement, their appearance is improved if a dark red stain is used in the cement, and if lines divide it into foot squares.

Use imitation marble sparingly, and, if used at all, avoid violent combination of color which produces disturbing and highly in-artistic effects.

Do not let the library directors' room be the choicest in the building, unless the room is used for library purposes when not in service by the directors or Library Board. A few libraries with small incomes are burdened with a sumptuously furnished room which is opened only for the meetings of the directors or board members, and which is absolutely useless at all other times. Public spirited directors will not be willing to devote an extravagant amount of money to furnish their own room at the expense of library work for the people. One Indiana library has both its directors' room and store room on the first floor. This arrangement takes too much valuable space where it is most needed, and in the building referred to it makes necessary too long a corridor from the entrance to the delivery desk.

In selecting colors for library walls select cream shades, soft light grays or other neutral tints, ordinarily. An experiment in an Indiana library with reds and terra cotta colors showed that these shades deadened artificial light and required twice the number of lights to get the same effect as a cream colored wall. A pleasing effect for library walls is obtained by tinting the rough under coat of plaster and dispensing with the smooth outer coat entirely.

Avoid having the plumbing system centralize near the library entrance. If repairs must be made to the plumbing it will be less unpleasant and unsanitary in the basement than elsewhere.

The mistakes mentioned above are of a kind sometimes made in Indiana libraries. The value of good light and ample space for books and people have generally been recognized. The most prevalent mistake, and this is a serious one, is a desire to erect a show building at the expense of a usable one. Civic pride calls for a building which shall be handsomer than the library possessed in

some neighboring town. The argument is made by some library boards that as the town can have but one library building it should be as handsome as possible. No fault can be found if there be sufficient money available to provide for an architectural gem and at the same time for a building which, through its usability and convenience, will help to uplift and advance the entire community. If one must be sacrificed, let it be the outward show or interior decoration. Even more beautiful than carved stone or decorated wall is an institution which, through efficient service, enriches the soul and beautifies the lives of the entire people.

EXAMPLES OF RECENT LIBRARY CONSTRUCTION IN INDIANA.

Great advancement in the construction of library buildings in Indiana has been made in the last ten years. The old-fashioned library building, with closed shelves and little attention to departmental work, is being succeeded by a class of buildings excellently adapted to the increased and varied demands which are being made on the public libraries of this State. The perfect library building has yet to be erected, but many in Indiana show the results in their arrangement of careful attention to library needs.

The Public Library Commission takes pleasure in showing a number of recently erected Indiana libraries, with their floor plans. Some of them show the results of better planning than others, with a laudable view to service and economical administration, but as a whole the libraries are usable, attractive library buildings. They are good examples of the type of buildings which have been erected recently in this State.

Bedford, Ind., Public Library.

Floor Plan of the Bedford, Ind., Library Building.

Stone building, 70 feet by 49 feet 6 inches. Cost, \$22,000. Capacity of stack room on one level, 13,000 volumes. Compact building, with good supervision. Commodious basement rooms. Patton and Miller, architects, Chicago.

Carthage, Ind., Public Library.

Floor Plans of the Carthage, Ind., Library Building.

Building 58 feet by 39 feet 10 inches. Built of brick with stone trimmings, for \$6,500. Commodious interior, with no partitions. No stack room. Kaufman, architect, Richmond, Ind.

Goshen, Ind., Library Building.

Reading Room. Goshen, Ind., Library.

Floor Plans of the Goshen, Ind., Library Building.

Size, 73 feet by 45 feet. Cost, \$25,000. Stone exterior. Space in stack room better utilized if parallel stacks were used. Auditorium in basement. Patton and Miller, architects, Chicago.

Huntington, Ind., Library Building.

Reading Room. Huntington, Ind., Library.

Floor Plan of the Huntington, Ind., Library Building.

Stone building, cost \$28,000. Has advantages of a two-story building with an auditorium and a museum on the second floor. Size of building, 70 feet by 60 feet 3 inches. Patton and Miller, architects, Chicago.

Indiana University Library Building.

Stone building, 135 feet 11 inches by 128 feet 7 inches. Cost, \$75,000. Reference room, 95 feet by 60 feet; stack room, 60 feet by 35 feet 8 inches; capacity of stack room, 250,000 volumes. Library has many noteworthy features. There are fourteen seminar rooms, faculty, conversation, staff and co-operative storerooms in the building. Patton and Miller, architects, Chicago.

Building of dressed stone. Cost, \$55,900.85. Stack room has capacity of 25,000 volumes. Wing and Mahuron, architects, Ft. Wayne, Ind.

Plainfield, Ind., Library Building.

Floor Plan of the Plainfield, Ind., Library Building.

Frame building, 40 feet by 25 feet. Cost, \$1,800. Library interior attractive and convenient. Hospitable looking porch entrance dominates the exterior of the building.

Poseyville, Ind., Library Building.

Floor Plan of the Poseyville, Ind., Library Building.

Represents smallest expenditure of any Indiana Carnegie library building. Cost, \$5,000. Size, 40 feet 8 inches by 30 feet 8 inches. Pressed brick with stone trimmings. High windows on side walls provide unbroken space for wall cases. Harris and Shopbell, architects, Evansville, Ind.

Rensselaer, Ind., Library Building.

Floor Plan of the Rensselaer, Ind., Library Building.

Size, 60 by 50 feet. Buff brick with stone trimmings. Cost complete, \$12,000. With exception of librarian's room, entire main floor is one-spacious, attractive room, with no dividing partitions. Auditorium, directors', storage and furnace room in basement. Weatherhogg, architect, Ft. Wayne, Ind.

Shelbyville, Ind., Library Building.

Floor Plan of the Shelbyville, Ind., Library Building.

Size, 71 feet 3 inches by 55 feet. Exterior of stone. Cost, \$20,000. Long approach to delivery desk. Interior color schemes and decorations attractive. Harris and Shopbell, architects, Evansville, Ind.

Fairbanks Memorial Library, Terre Haute, Ind.

Building 120 feet by 74 feet, constructed of stone and furnished throughout with Library Bureau furniture. Cost, \$75,000. Gives a fine impression architecturally.

Children's Room. Fairbanks Library, Terre Haute, Ind.

Delivery Hall, Fairbanks Library, Terre Haute, Ind.

Floor Plan of the Fairbanks Memorial Library Building, Terre Haute, Ind.

Westfield, Ind., Library Building.

Reading Room. Westfield, Ind., Library.

Double frame cottage, costing originally about \$500, remodeled into a successful library building. Ample wall space. Good light and supervision given by removal of partitions. Gives efficient service to a town of 670 inhabitants.

COUNTY LIBRARIES.

Having passed through the formative period in library organization, association, technical processes and building, the time seems fully ripe for a discussion of that form of library extension designated as county libraries.

A few years ago when this subject was being considered in different sections of the United States there were many who felt that, while here and there were to be found counties the library conditions of which were such that county libraries might be safely and satisfactorily conducted, in most counties there was too much to be accomplished in the organization and reorganization of libraries, training of librarians, erection of buildings, State and interstate co-operation to warrant the adoption of a general system of county libraries, which presents problems requiring the most delicate and careful handling.

In the United States county libraries, as far as is known, were first established by law in Indiana in 1816. At that period in our State's history the capital was located at Corydon, Harrison County. Under the spreading constitutional elm, men of large heart, brain and vision met to adopt a constitution for the commonwealth, and in their wisdom made provision for the establishment of county libraries in Article 9, Section 5, which reads as follows:

Sec. 5. The General Assembly, at the time they lay off a new county, shall cause at least 10 per cent. to be reserved out of the proceeds of the sale of town lots in the seat of justice of such county, for the use of a public library for such county, and at the same session they shall incorporate a library company under such rules and regulations as will best secure its permanence and extend its benefits.

At the first session of the General Assembly provision was made for the establishment of a county library in Pike County:

Section 1. Be it enacted by the General Assembly of the State of Indiana, That the qualified voters of the County of Pike, are hereby authorized to assemble themselves at the place of holding courts in said

county, on the first Monday in September next, and on the first Monday in September in every year thereafter, and when so assembled, may, and they are hereby required (after having first chosen a chairman and a secretary) to elect a president and five trustees for the county library of said county, to serve for the term of one year, and until their successors are duly elected and qualified; and the president and trustees chosen in manner aforesaid together with the qualified voters of said County of Pike, are hereby created and declared to be a corporation and body politic with perpetual succession by the name of the president, trustees and proprietors of the County Library of the County of Pike, and shall in their corporate capacity be able and capable in law, to sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended in any court of justice, and to make and use one common seal, and the same to change and alter at pleasure.

Sec. 2. The president and trustees elected in manner aforesaid, and the president and trustees elected at every annual election thereafter, shall within ten days after their election severally take an oath or affirmation, before some person authorized to administer the same, for the faithful performance of the duties of their office, before he or they shall be authorized or permitted to exercise the same.

Sec. 3. The president and trustees qualified in manner aforesaid, shall proceed by ballot to elect one librarian and treasurer, and such other subordinate officers as they may think necessary, and shall have power from time to time, and at all times thereafter, to make such by-laws, ordinances and regulations in writing not inconsistent with the laws of this State and the constitution of the United States, as may be necessary for the government of the institution. The treasurer shall give bond with such security as the president and trustees may direct.

Sec. 4. The General Assembly of this State reserve the power of altering or amending this act and to alter or amend any by-laws of said corporation, when to them it may appear necessary or advisable so to do.

Sec. 5. The agent of the county seat of said County of Pike is hereby required to pay over to the treasurer of said corporation all sums of money which he may receive from the sales of lots in the county seat of said county by virtue of the constitution and laws of this State, for the benefit of a county library whenever required so to do by the president and trustees of the corporation aforesaid.

Sec. 6. The president and trustees of the county library aforesaid are authorized to demand and receive upon their order, all moneys that may be paid into the treasury of their corporation for the benefit of a county library for said county, and lay out the same in the purchase of books, and such other property, real or personal, as they may think conducive to the advancement and benefit of said corporation, subject to such rules and laws as the General Assembly may at any time establish; provided, however, that the said corporation shall at no time hold any property, real or personal, except books, to a greater amount than five hundred dollars.

Sec. 7. The same power, privileges and authority that are granted to the qualified voters of the County of Pike, to organize, conduct and sup

port a county library, by virtue of the preceding sections of this act, are hereby extended and granted to the qualified voters of the Counties of Daviess, Jennings and Sullivan.

This act shall be in force from and after its publication.

ISAAC BLACKFORD,
Speaker of the House of Representatives.
CHRISTOPHER HARRISON,
President of the Senate.

Approved January 2, 1817.

JONATHAN JENNINGS.

This was followed in 1818 by special legislative enactments for the establishment of county libraries in Dubois, Lawrence, Monroe, Randolph, Ripley and Vigo counties.

On January 28, 1824, the first legislative provision for the manner of organizing and conducting county libraries was passed.

Section 1. Be it enacted by the General Assembly of the State of Indiana, That whenever the citizens of any county shall be desirous of incorporating a county library, it shall be lawful for the qualified voters of such county, twenty days' previous notice having been given, by putting up at least one manuscript advertisement in each township of such county, one of which shall be at the place where the courts are holden, to assemble themselves at the courthouse, or place where courts are usually holden, and when so assembled, and having chosen a chairman and secretary, to proceed to elect a president and seven trustees, for the county library of such county, to serve for the term of three years, from and after the first Monday of September next ensuing their election, and until their successors shall be elected and qualified; and all elections for president and trustees of county libraries shall be held annually, on the first Monday of September, as their terms of office shall respectively expire.

Sec. 2. The president and trustees, chosen in manner aforesaid, together with the qualified voters of such county, are hereby created and declared a corporation and body politic, with perpetual succession, by the name and style of the president and trustees of the _____ County Library; and shall in their corporate capacity be able and capable in law, to sue and be sued, plead and be impleaded, answer and be answered unto, defend and be defended in any court of justice; and to make and use a common seal, and the same to change and alter at pleasure; and when any vacancy shall happen by the death, resignation, or removal of the president or any of the trustees as aforesaid, the remaining trustees shall appoint another person or other persons to fill such vacancy or vacancies.

Sec. 3. The president and trustees elected in manner aforesaid, and their successors in office, shall severally take an oath or affirmation, before some person authorized to administer the same, for the faithful performance of the duties of their office, before he or they shall be authorized to enter upon the duties thereof.

Sec. 4. The president and trustees qualified in manner aforesaid shall elect by ballot a librarian and treasurer, and such other subordinate officers, as they may think necessary, and shall have power from time to time, and at all times thereafter, to make such by-laws, ordinances and regulations in writing, not inconsistent with the constitution and laws of this State and of the United States, as may be necessary for the government of the institution. The treasurer shall give bond with such security as the president and trustees shall direct.

Sec. 5. The agent of any county, in which there may be an incorporation as aforesaid, shall on the presentment of an order, signed by the president and attested by the clerk thereof, forthwith pay to the treasurer of the same, all moneys in his hands, due said library; and on failure thereof said treasurer shall proceed against such delinquent agent, by motion in the circuit court, having given ten days' previous notice thereof, and the court aforesaid shall give judgment against said agent and his securities, for such sum as may be found due to said County Library, together with interest and costs; and execution without stay thereon shall be awarded.

Sec. 6. In case of the absence of the president at any meeting of the trustees aforesaid, the said trustees shall have power to elect one of their own body, to serve as president pro tempore, until the president shall attend, provided that not less than a majority of the trustees elected or appointed as aforesaid shall form a quorum to transact business.

Sec. 7. The president and trustees of the County Libraries as aforesaid are hereby authorized to demand and receive, upon their order, all moneys that may be paid into the treasury of their corporation, for the benefit of a county library for such county, and lay out the same in the purchase of books, maps, etc., and such other property, real and personal, as they may think most conducive to the advancement and benefit of such corporation, subject to such regulations as the General Assembly may at any time establish; provided, however, that the said corporation shall not in their corporate capacity at any time hold more than the value of one thousand dollars, in real and personal property, books excepted.

Sec. 8. The General Assembly shall as often as to them it may appear necessary and advisable, alter or amend this act, or any of the by-laws of such corporations.

Sec. 9. Ten per cent. of the proceeds of the sale of town lots at the seat of justice, of every county hereafter laid off, shall be reserved for use of a public library for such county, to be collected and paid over as provided for in this act; and for the purpose of more effectually securing the ten per centum arising from the sales of town lots at each county seat, established by the laws of this State, the county agents of such counties, severally, shall not be subject to obey any order, made by the different boards of county commissioners, which would authorize the said agents to receive anything but specie or its equivalent, for the ten per centum reserved by law, on the amount of the sales of lots at such county seats, for the use of county libraries. And in all cases where any county agent may have heretofore, in obedience to the orders of the board of county commissioners of his proper county, taken and received county orders, in payment of debts due for town lots, in any county seat established as aforesaid, it shall and may be lawful for such agent to apportion

the amount of the ten per centum, due such County Library (and received in county orders as aforesaid), on all the debts still due such county, for town lots, according to the sums each individual may be owing; and until such agent may have a reasonable time to collect such sum due, no action shall lie against him, by the board of county trustees of the County Library of his county, for failure to pay such library fund.

In 1825, on February 7, an act was approved amending Sections 2, 3 and 4 of the Act of 1824, but only slightly, and in no way changing the essential features of the law, and therefore are not quoted. The amendment referred to may be found in Acts of 1825, p. 46. There were, however, in 1831, February 9 (R. S. 1831, p. 361), some changes and additions to the Act of 1824 which should have added much to the efficiency of the county libraries by providing for better care of funds already collected.

The changes of chief value are found in the following sections:

Sec. 10. Should it hereafter happen in the sale of town lots, in any county in this State, where by law a reservation of ten per centum on the amount of sales had been made, for the use of a county library, that the agent of such county has paid over the whole amount, or all that he has received of the purchase money of any lots, into the county treasury of his county, without reserving and deducting the said ten per centum for the use of the county library, such county shall be held responsible to the president and trustees of the county library, for the amount of the ten per centum aforesaid; and it shall be the duty of the board doing county business in said county, on satisfactory proof of the above state of facts, by an order entered on their records, to direct the treasurer of their county to pay the full amount of the ten per centum so received, to the president and trustees of the county library, out of any moneys belonging to said county not otherwise appropriated.

Sec. 11. That hereafter no county library, the books of which have been purchased by the funds in this act reserved and set apart for that purpose, shall be liable for the (any) debts of the county, or be subject to seizure by execution or otherwise, in any case whatever.

Additional funds were made available for county libraries by an act passed by the General Assembly in 1847. [Acts 1847, p. 103.]

Section 1. Be it enacted by the General Assembly of the State of Indiana, That the board doing county business in the several counties in this State be hereby authorized to make an annual appropriation in any sum not exceeding twenty-five dollars in any one year; which sum so appropriated shall be drawn from the treasurer of said county, and shall, under the direction of the trustees of said library, be applied to the repairing and gradual increase of said libraries.

Indiana witnessed a remarkable library development in 1852, when town association, county and township library acts were

passed, and William McClure, the associate of Robert Dale Owen in his New Harmony movement, made possible the establishment of the McClure Workingmen's Institute Libraries. The county law was as follows:

Section 1. Be it enacted by the General Assembly of the State of Indiana, To establish and maintain a public library in each of the several counties, for the use of the inhabitants thereof, there shall be reserved ten per cent. of the net proceeds of all lots within the town where the county seat is situate, sold as the property of such county, and ten per cent. upon all donations made to procure the location of such county seat; and the county commissioners shall make the necessary order for the collection and payment of the same.

Sec. 2. The board of commissioners doing county business may at their June session in each year appropriate a sum not less than twenty, nor more than seventy-five dollars, for the purchase of books, maps and charts for such library, and the same shall be paid to the treasurer of the library, by the treasurer of the county, upon the certificate of the auditor thereof.

Sec. 3. The clerk, auditor and recorder shall have the charge of such library, and are hereby constituted trustees for that purpose. They shall elect one of their number treasurer, and a suitable person librarian, and shall prepare a proper room, with the necessary shelves and cases, within some county office, or building when practicable, to place and safely keep such library. They shall cause all money appropriated or belonging to the library, to be expended in the purchase of books, charts and maps, and report to the board of county commissioners in June annually, the kind and number of books purchased, with the cost thereof. Each of said officers shall be liable on his official bond for the performance of duties herein required of him.

Sec. 4. Every inhabitant of the county giving satisfactory evidence or security for the safe keeping and return of books, shall be entitled to take and use the same upon proper application to the librarian. But no one person shall at the same time have more than two volumes of books, nor for a longer period than forty days, without returning such books to the library.

Sec. 5. The trustees shall establish by-laws and rules for the regulation of such library, and the same shall be placed at a conspicuous point in the library room for the inspection of visitors. All fines or forfeitures accruing from the violation of such by-laws shall be recoverable in an action before any court of competent jurisdiction in the name of the State of Indiana, for the use of such library; and the librarian shall be a competent witness in such action, and the entries made upon his books, in relation to such library, shall be prima facie evidence of the things therein charged.

Sec. 6. The librarian shall make an entry in a proper book of each book or map taken, the time thereof, by whom and when returned. He shall also keep a registry of the fines and penalties assessed, and collect the same by suit or otherwise. At the June session of the board of county

commissioners in each year he shall report the condition of such library, the books added, or lost, within the preceding year, and the value of the same.

Because of the defects of the system due to lack of transportation and communicating facilities, and to the lack of the personal supervision of efficient librarians, this first county law failed of its purpose, though it performed a valuable service to the people of the State.

Not many States followed Indiana's county library plan, though it is of interest to note that in recent years Wyoming and Ohio have passed county library acts. In Van Wert, Ohio, the county commissioners are authorized to levy a maximum tax of half a mill on each dollar of taxable property of such county for the benefit of a county library after a building or property has been donated for that purpose.

For an intelligent discussion of this subject it is necessary to note the law governing the Cincinnati library (Sec. 3999a), which contains the following provisions:

Section 3999a. Each and every resident of the county within which is situate any city of the first grade of the first class, having therein established a public library, shall be entitled to the free use of such library, reading rooms, and any branch of the same, and all the privileges thereof, upon such terms and conditions not inconsistent therewith, as the board of trustees of such library may prescribe.

They (the board of trustees) shall have power, and it shall be their duty to establish in said city and throughout the county within which is situated said library, reading rooms, branch libraries, and library stations, in connection with said library, and to lease and furnish said rooms, buildings, or parts thereof, as are required for such purposes, and to pay all necessary expenses connected therewith.

Sec. 3999c. For the purpose of increasing, maintaining, and managing the public library in cities of the first grade of the first class, may levy annually a tax of not to exceed three-tenths of one mill on each dollar valuation of the taxable property in the county, wherein is situated such city, to be assessed, collected and paid in the same manner as are other taxes levied throughout the county.

The privileges of the Public Library of Cincinnati were thus extended to the residents of Hamilton County in April, 1898, by an act of the Legislature of Ohio passed April 21, 1898. By this act the "Board of Trustees * * * may levy annually a tax not to exceed five-tenths of one mill on each dollar valuation of the taxable property in the county."

The readers are served by means of branch libraries, delivery stations, traveling libraries and in some cases small libraries for the use of the women's clubs have been deposited at the nearest delivery station. There are six branch libraries *outside of the city limits* in the suburbs of Wyoming, Madisonville, Lockland, Hartwell, Harrison and Pleasant Ridge, and Norwood. The smallest of these libraries contains 864 books, the largest 10,000. These branches are also delivery stations. The delivery stations contain no books; the circulation is directly from the main library, the books being sent to the stations several times each week, in some cases every day. There are twenty traveling libraries in the rural districts of the county, remote from railroad and express companies. The county is divided into five circuits, with four libraries in each circuit. These libraries contain sixty volumes, a selection of good literature in the various classes—a large proportion of them juvenile. These are deposited in schoolhouses and stores or in homes, if no more suitable place can be found. They remain in one locality about six months, or until the books have all been read, and they are then removed to another place. When the circuit is completed the libraries are returned and a new lot of books is sent out. The Public Library has also deposited libraries in fifteen schools of the county. These are sent out for the school year and returned to the library at the close of school in June.

This refers only to the work outside of the city limits. Within the city there are delivery stations, school deposit libraries, libraries in the engine houses of the city fire department, home libraries, etc. Mr. Carnegie has donated a number of branch library buildings to Cincinnati.

The county libraries in the United States may be divided into three classes: *First*, those provided for by the laws of Indiana, Maryland and Ohio, making it possible to establish and maintain a county library at the county seat; *second*, the extension of the privileges of a city library to the people of the county, as in the case of Cincinnati and in part by Portland, Oregon; and *third*, the system of county traveling libraries provided for by Minnesota and Wisconsin.

In considering the essentials of a county library law, Indiana should move carefully in the adoption of any general law which

might work hardship or be unacceptable to many of the libraries located in county seats. To insist upon any general system of county library extension would be unwise. In some counties general public sentiment is not sufficiently aroused to support a public library; in others the libraries located at some county seats lack proper library facilities and can not therefore well extend them.

A CENTURY OF LIBRARY DEVELOPMENT IN INDIANA.

- 1807. Library law concerning Vincennes University Library passed by territory.
- 1816. County library provision included in adoption of constitution of the State.
Resolution introduced to establish State Library.
- 1818. County libraries established.
- 1825. State Library organized.
- 1852. William McClure established by bequests Workingmen's Institute Libraries.
Township library law enacted.
Library association act passed.
- 1873. School library law.
- 1883. School library law.
- 1891. State Library Association organized.
- 1899. Public Library Commission created by act of General Assembly.
Traveling Libraries circulated.
- 1901. Public Library law enacted.
State Organizer appointed by Commission to organize libraries and give information and advice concerning their administration.
First Carnegie library donation made in Indiana.
- 1902. School for Librarians conducted at State House.
- 1903. Commission law of 1899 amended.
Library law of 1901 amended.
Library work with schools introduced.
- 1905. Commission law of 1899 amended.
Normal school courses conducted by Public Library Commission.
One-year course in library training opens at Winona Technical Institute, Indianapolis.

RULES AND REGULATIONS FOR PUBLIC LIBRARIES.

SUGGESTED BY THE PUBLIC LIBRARY COMMISSION.

1. The library and reading room shall be open on all secular days except legal holidays, from to o'clock each day. The reading room shall be open on Sunday afternoons from 2:00 to 5:30.

2. The librarian, under the control of the Board of Directors, shall have charge of the rooms and working force of the library, and shall be responsible for the care and safety of the books, periodicals and other public property contained therein, and for the preservation of order in the rooms.

3. Any person may use the reading room; but no newspapers periodicals or other reading matter shall be removed therefrom. The use of tobacco, all conversation and conduct not consistent with the quiet and orderly use of the library and reading room are prohibited.

4. Any resident of (or township) is entitled to the use of the books of the library, by giving as security the signature of some responsible citizen upon the certificate furnished by the librarian. Any stranger or one who, for any reason can not give such guarantee by depositing three dollars may draw books from the library. For such deposit a receipt will be given, and this money will be refunded when the card is surrendered. If a tax is not levied in township for the support of such library, any resident of said township may obtain the use of the books in the library by paying one dollar per annum and furnishing the security required of others.

5. Each person entitled to draw books from the library will be supplied with a card inscribed with his or her name, residence and register number. This card must be produced with the book taken, returned or renewed. Lost cards will be replaced at the expiration of seven days upon the payment of five cents. Immediate notice of a change of residence must be given to the librarian.

6. The holder of a card is entitled to draw one volume at a time, or more volumes of the same work, at the discretion of the librarian.

7. Books may be retained two weeks, and may be once renewed for the same period. Application for renewal must be made within the first fourteen days.

8. Any book of recent purchase, labeled "Seven day book," can not be retained more than one week in any one household, and can not be renewed.

9. Encyclopedias, dictionaries and such other books as may be unsuited for general circulation are marked capital R, and can be used only in the library rooms. Readers wishing to look up any particular subject are urged to consult the card catalog and librarian. Two books will be placed in the reading room for the use of clubs, schools and individuals upon request.

10. A fine of two cents a day shall be paid on each volume which is not returned according to the provisions of the preceding rules; and no book will be delivered to the party incurring the fine until it is paid.

11. Writing in books is prohibited. All injuries to books beyond reasonable wear, and all losses shall be promptly adjusted to the satisfaction of the librarian. If one volume is lost, the loser will be responsible for the value of the set, unless the lost volume is satisfactorily replaced.

12. Delinquents will be notified through the mail on the first day after their delinquency has occurred, and two weeks thereafter, if the book is not returned, the guarantor will be notified. If the book is not returned within one month after serving of the first notice, the librarian shall proceed to collect, through the proper channels, the value of the book with the accrued fines and other charges to the date of payment.

13. The Board of Library Directors may, whenever it deems advisable, ask for a renewal of the security required by Rule 4.

14. These regulations are subject to alteration, amendment or revision at the discretion of the Board of Library Directors.

PARAGRAPH REPORTS CONCERNING INDIANA LIBRARIES.

INCLUDES LIBRARIES GIVEN AID BY THE PUBLIC LIBRARY COMMISSION DURING THE LAST TWO YEARS, AND THOSE WHICH HAVE SPECIAL FEATURES OF INTEREST IN THEIR WORK.

Libraries marked * designates in reports received as furnishing data from the library's last fiscal year and not the last calendar year.

Alexandria, Madison County.—Population, 7,000. Public Library. Carnegie building, cost \$14,000. Number of volumes, 3,200, of which 280 were added last year; new borrowers, 475; circulation, 18,450. Miss Orpha Maud Peters, a graduate of the Library Commission summer school, was appointed librarian to succeed Miss Cunningham, resigned. Library income, \$1,885.58. Books are loaned to anyone in the township. Reference work is done for clubs and schools. Children's bulletins are provided and there are children's story hours.

Alexandria High School Library.—Number of volumes, 743. Library is under the supervision of the high school teachers and is used very extensively. Books are purchased from the special school fund.

Anderson, Madison County.—Population, 23,000. Public Library. Carnegie building, cost \$52,000. Number of volumes, 11,922; additions, 971; circulation, 46,987; income, \$5,000. Miss Katherine A. Chipman, librarian, has had Chautauqua summer library school work.

Attica, Fountain County.—Population, 3,000. Carnegie building, cost \$10,000. Number of volumes, 2,771; additions, 406; circulation, 9,737; income, \$1,000. Library was started by the women's clubs of Attica, which opened a library and reading-room in a rented frame building, and afterwards turned the library over to the city when it was reorganized under the laws of 1901-03. Miss Daisy Henley of Wabash directed the cataloging of the library and help was given the library in the selection of building plans and in the reorganization by the Public Library Commission. Miss Katherine Fisher is the librarian.

Aurora, Dearborn County.—Population, 3,645. Number of volumes, 4,230; additions, 247; circulation, 10,600. Library was originally a subscription one and was taken over by the city. It occupies rooms in the Aurora city building, and is operating under a special library act.

Bedford, Lawrence County.—Population, 7,500. Organized under a special law with stockholders and has county extension. Carnegie building, cost \$22,000. Number of volumes, 8,000; additions, 1,133; new borrowers, 610; circulation, 35,300; income, \$2,260; \$738 expended annually for books. Miss Georgianna A. Friedley, librarian, has had two terms' work at the Indiana Library Commission summer school; Miss Rogers, assistant, has had one term of school work under the Library Commission. Miss Sue Dodd, former assistant, has become a general organizer, and has done excellent work at Greensburg, Mt. Vernon and other places. Senator Thomas Brooks and Joseph R. Voris, the latter formerly a member of the Public Library Commission, have been active members of the Bedford Library Board and are deeply interested in the library's development.

*Bloomington, Monroe County—Population, 10,000. Indiana University Library. A new library building is being erected at a cost of \$75,000. Number of volumes, 55,149; additions, 4,944; circulation, 61,716; income, \$17,375; annual expenditure for books, \$8,000. William E. Jenkins, librarian, took a special course at the New York State Library School. The library has ten assistants.

Bluffton, Wells County.—Population, 5,000. Carnegie building, cost \$19,262. Number of volumes, 7,001; additions, 445; number of borrowers, 2,168; circulation, 30,579; income, \$1,500. Miss Bertha Craven, librarian, received library training at the Indiana Library Commission's summer school. Special work has been done by the library with the schools and more is planned for the coming year. Teachers have brought classes to the library and the children were shown how to use the books for reference work, etc. The collections of pictures and bulletins have been in great demand by teachers and students. Picture books recommended by the Library Commission have given great delight, and special work has been done with women's clubs. E. B. Williamson and Charles C. Deam, of Bluffton, presented a collection of birds' eggs,

valued at \$300, to the library; the Federation of Clubs gave a painting by Vervier, valued at \$250; and another valuable picture was the gift of C. E. Coverdale.

Brazil, Clay County.—Population, 10,000. Carnegie building, cost \$20,000. Miss Agnes McCrea, librarian, received some special training with the Indiana Library Commission. The chief industry of Brazil is coal mining, and an important feature in future library work should be with the mine employes. The State Organizer of Libraries has made two visits to Brazil in the interest of reorganization, and the arranging of books in the older library on a better system of classification.

Carmel, Hamilton County.—Population, 500. Number of volumes, 570; additions, 78; circulation, 754; annual expenditure for books, \$50. Library Board lacks two members owing to the school management being vested in the township. Miss Dove Stephenson is the librarian. Through a misunderstanding a different tax assessment was made by the Town Board from that fixed by the Library Board for the support of the library, but a decision from the Attorney-General's office was to the effect that the Library Board alone had the power to fix the assessment so long as it kept within legal limit. Excellent work is being done by the library, which is patronized very largely. Assistance was given the librarian by Miss Arnold, Assistant State Organizer; who spent several days at the library.

Carthage, Rush County.—Population, 1,100. Library building costing \$6,500 was erected from gifts and taxation. Number of volumes, 3,924; additions, 210; circulation, 8,694; total income, \$595.35; annual expenditure for books, \$151. Librarian, Miss Mattie Clark. Much stimulus was given the library by the library institute conducted there under the auspices of the Library Commission. Miss Mendenhall, of the Commission's force, also conducted valuable work with schools over the township. Several meetings with teachers have been held at the library. The library has been entirely recataloged. Much of this work was done under the care of Miss Lillian Henley, assisted by Miss Hazel Coffin, who were graduated from Winona Technical Institute Library School in June, and who performed their practice work at the Carthage library.

Columbus, Bartholomew County.—Population, 8,030. Carnegie building, cost \$17,500. Number of volumes, 7,524; additions, 670; new borrowers, 310; circulation, 26,376; income, \$4,212.60; annual expenditure for books, \$390.42. Miss Carrie Ong succeeded Miss June Deming as librarian.

Crawfordsville, Montgomery County.—Population, 7,000. Carnegie building, cost \$32,500. Number of volumes, 7,000; additions, 929; circulation, 25,732; income, 2,600; annual expenditure for books \$913.88. Miss Katherine Beck, librarian, received her library instruction with the Indiana Library Commission and at Drexel Institute Library School, Philadelphia. Miss Bess C. Bridges, former assistant, attended the Indiana Library Commission's summer school for librarians. There has been discussion at Crawfordsville in favor of reorganizing under the laws of 1901-03.

Crawfordsville.—Wabash College Library. Number of volumes, 41,000. H. S. Wedding, librarian. Much work is being done in the library by the student body, and valuable assistance is given, particularly in reference work, by the librarian. The collection of books is an exceedingly well selected one.

Danville, Hendricks County.—Central Normal School Library. Number of volumes, 4,000, and free access. Miss Mendenhall, of the Library Commission office, gave a normal school course at the Central Normal to instruct the teachers how to use the books and libraries. Librarians at the Normal school change yearly, as students are selected for this work annually.

Delphi, Carroll County.—Population, 2,035. Carnegie building, cost \$10,000. Number of volumes, 2,737; additions, 231; new borrowers, 130; circulation, 6,953; income, \$1,284.36; annual expenditure for books, \$47. The library was reorganized from an old school library. Miss Gertrude McCain, librarian, attended two sessions of the Indiana Library Commission's summer school for librarians. Library reorganization at Delphi followed a public meeting in the court house, where the State Organizer spoke on "Reorganization and Steps in Securing a Carnegie Building," at the request of the Oracle Club. Mrs. N. J. Howe was untiring in her efforts to secure a modern library, and in this she was ably assisted by Mayor Ives, Dr. Robinson and Superintendent of Schools Hendricks. The library is a good ex-

ample of steady growth through the assistance of an interested community and a capable librarian. Miss Emma Myer, the first librarian, had instruction under the Indiana Library Commission, after which she went to Albany, N. Y., and then accepted a position in the Buffalo (N. Y.) public library. Miss Lena Almond, one of the assistants in the earlier reorganization, is a graduate of the Winona Technical Institute Library School.

Earl Park, Benton County.—Population, 563. Number of volumes, 480; total income, \$203. The library has been opened since the Commission's last report. Mrs. Charles B. Stuart, of Lafayette, daughter of Adams Earl, who founded Earl Park, donated the library furnishings, librarian's salary and the rent of five rooms, to the amount of \$1,806. One of the features of the library is a comfortable rest room for the use of those who visit the library from a distance. Miss Zada Carr has been appointed librarian to succeed Miss Mabel Bonnell, resigned. Miss Bonnell had library instruction at the Indiana Library Commission summer school, and Miss Carr was graduated from the Winona Technical Institute Library School, 1906.

Elkhart, Elkhart County.—Population, 20,000. Carnegie building, cost \$35,000. Number of volumes, 11,884; additions, 2,073; number of borrowers, 5,352; total income, \$3,500. During the last year, 584 books were withdrawn from circulation in the library. They were of the Horatio Alger, Harry Castlemon or Elsie Dinsmore variety. An excellent showing has been made by the librarian in the decreased reading of fiction at the expense of nonfiction books. A little over a year ago the proportion of fiction circulated as compared to nonfiction was ten to one. The library catalog has been greatly amplified and 30,000 cards have been added. Library of Congress cards are subscribed for and sets of the A. L. A. cards are frequently bought. A successful children's department is in operation and is growing in favor every day, and a marked increase is shown also in the amount of reference work done at the library. Miss Ella F. Corwin, librarian, was formerly with the Michigan State Library. Miss Harriet Shelly, first assistant, and Miss Edna Seiler, second assistant, have attended the Indiana Library Commission summer school.

Elwood, Madison County.—Population, 14,000. Carnegie building, cost \$30,000. Number of volumes, 5,383; additions, 467; new borrowers, 929; circulation, 32,841; total income, \$2,946.17; annual expenditure for books, \$309.54. Features at the library are clubrooms, children's room, men's smoking-room and an auditorium. There is special work with children through bulletins, while story hours and League of Good Citizenship meetings alternate on Saturdays from October to May. In the work with schools there are displays from week to week of the best art work done in the schools; there is a graded catalog; special lists are made out for teachers, and bulletins are posted at their request; books in use by the schools are withdrawn from general circulation and placed on "school shelves" and may be taken from the library overnight only. Magazine articles and pictures are mounted and classified. The usual help with programs is given to clubs. Bibliographies on individual topics are made out as soon as programs are printed, and these are mailed to club members. Clubrooms are provided at the library, and pictures and illustrative material in the library are made available. Miss Ethel F. McCullough, librarian, is a graduate of the New York State Library School.

Evansville, Vanderburgh County.—Population, 70,000. Willard Library. Number of volumes, 70,000; limited access to shelves. The library is endowed. Librarian, Miss Otilda N. Goslee. There are two assistants.

Ft. Wayne, Allen County.—Population, 45,115. Carnegie building was dedicated in 1904, the State Organizer taking part in the dedication program; cost, \$120,000. Number of volumes, 21,403; additions, 2,600; new borrowers, 1,093; circulation, 65,191; total income, \$8,073.19; annual expenditure for books, \$3,915.61. The library was organized by the Woman's Club League at the suggestion of Mrs. Alice P. Dryer. Miss Margaret M. Colerick, librarian. Of the assistants, Miss Sturgis and Miss Briggs had library instruction at the Indiana Library Commission summer school. Miss Grace Smith, an assistant, is a graduate of the Winona Technical Institute Library School. There is need of a children's librarian, and those interested have discussed the library's reorganization under the laws of 1901-3, and have consulted the Library Commission regarding this.

Frankfort, Clinton County.—Population, 7,100. Number of volumes, 3,922; additions, 1,151; new borrowers, 855; circulation, 27,497. Librarian, Miss Ethel Brumbaugh. Seventeen thousand five hundred dollars has been given Frankfort for the erection of a new library building and contracts for it have been awarded.

Goshen, Elkhart County.—Population, 10,000. Carnegie building, cost \$25,000. Number of volumes, 6,037; additions, 786; new borrowers, 499; circulation, 29,616; total income, \$2,503.53; annual expenditure for books, \$473.01. Ella R. Heatwole, librarian, has had two terms of instruction at the Indiana Library Commission's summer school. It is unfortunate, from the Library Commission's viewpoint, that it is thought wise not to make re-appointments of members of the Goshen Library Board, when these have been entirely satisfactory.

Greencastle, Putnam County.—Population, 3,661. Carnegie building, cost \$20,000. Number of volumes, 8,019; additions, 214; new borrowers, 784; circulation, 17,567; total income, \$15,000. Belle S. Hanna, librarian. Effective work done with the students in the public schools and university.

Greencastle, DePauw University.—Number of volumes, 29,000. Library income is from investments and donations. Miss Mabel Bonnell, acting librarian, had library instruction at the Indiana Library Commission summer school. Fifty thousand dollars has been donated by Mr. Andrew Carnegie for the erection of a library building. An equal endowment fund is being raised by friends of the university.

Greensburg, Decatur County.—Population, 5,034. Carnegie building, cost \$15,000. Number of volumes, 2,878; additions, 160; new borrowers, 1,446; circulation, 21,457; total income, \$1,500; annual expenditure for books, \$68.21. Bessie Montfort, the former librarian, died, and was succeeded by Frank P. Montfort. By the death of Miss Montfort Indiana lost one whose contribution to library extension and progress can not be over-estimated. The library cataloging was done under the direction of Miss Sue Dodd, and serves as a model. The library was organized after a vote at a regular spring election, following a mass meeting of citizens the night before, participated in by a representative of the Indiana Library Commission.

Hammond, Lake County.—Population, 13,000. Carnegie building, cost \$25,000. Number of volumes, 3,850; additions, 1,300; new borrowers, 600; circulation, 22,450; total income, \$2,500; annual expenditure for books, \$1,297.42.

Hanover, Jefferson County.—Hanover College Library. Mrs. Thomas A. Hendricks gave \$25,000 for the erection of the library building as a memorial to Vice-President Hendricks. Number of volumes, 20,000; library's source of income is from fees. Lelia Garritt, librarian.

Hartford City, Blackford County.—Population, 8,000. Carnegie building, cost \$15,000. Number of volumes, 2,849; total income, \$1,500. Miss Grace Horne, librarian, had instruction with the Wisconsin Library Commission summer school.

Huntington, Huntington County.—Population, 10,000. Carnegie building, cost \$28,000. Number of volumes, 15,000; additions, 1,551; new borrowers, 1,211; circulation, 32,595. Winifred Ticer, librarian, has had library instruction at the Indiana Library Commission summer school. Interesting work is done by the library with the high school students and with the clubs of Huntington. Eight or ten programs of the clubs are sent to the library, and reference work for them is done during spare time by the librarian. The library uses a local business college to advantage, by having the college students typewrite lists of books for the various grades in the public schools. This is done free of charge, as the lists are considered as practice work at the business college. One month the lists will contain all the bird books in the library, and the next month all animal books will be listed, and so on. Last December the librarian had every book in the library which contained a Christmas story bound in red canvas, and these were put in a revolving case near the entrance and were greatly appreciated by those in search of Christmas reading material. Last spring the library had an exhibition of old books belonging to Huntington citizens, and as a result, large crowds became interested in the collection and many were presented to the library. The library is using the Library of Congress cards for cataloging at present, with much success, the librarian reports.

Indianapolis, Marion County.—Population, 207,000. Bona Thompson Memorial Library; cost \$45,000. Gift of Mr. and Mrs. E. C. Thompson. Number of volumes, 9,300; additions,

524. Margaret Carlisle, librarian. Miss Ethel Cleland, a graduate of Butler College and of the Winona Technical Institute Library School, spent several weeks in amplifying the card catalog, inserting analytics, etc. Prof. Demarchus Brown, the newly appointed State Librarian, has been in charge of the library for several years.

Indianapolis, Institute for Education of the Blind Library.—Number of volumes, 1,981; total income, \$500; annual expenditure for books, \$499.54. Library support from State. The books in print are for the teachers principally, and are for oral reading and reference. The embossed library is in New York point and is for the pupils, and consists of text-books and books for reference. Books are loaned for use in the reading room and for use in the private rooms. When school is in session the library is in charge of the teachers. The Assistant State Organizer and Instructor had charge of the classification of the books for the blind and, recently, the pupils of the W. T. I. library school at Indianapolis have spent several hours each week in recataloging the teachers' general library. This work continues under the supervision of the Assistant State Organizer.

*Indianapolis Public Library.—Building erected in 1892 at a cost of \$150,000, from the sale of bonds. Number of volumes, 116,819; additions, 5,330; number of new borrowers, 5,002; circulation for the year, 326,717; total income, \$78,983, which is from taxation; annual expenditure for books, \$6,000. Miss Eliza G. Browning, librarian. Miss Jessie Allen, reference librarian, has been a student at the N. Y. State Library summer school; Miss Dye attended the Pratt Library School; Misses Herzsch, Rhoda Shepard, Finch, Dippel and Cochran have attended the Indiana Library Commission summer school. The Indianapolis Public Library has eight branches, and books are loaned through the public schools and deposit stations. The possibilities of the library have been greatly increased through the acquiring of much additional room through the vacating of quarters in the library building by officers of the Indianapolis public schools. The children's room is one of the attractive features of the Indianapolis Library.

Indianapolis, Indiana State Library.—Number of volumes, 43,000; additions, 2,560; total income in 1906, exclusive of salaries, \$9,000; annual expenditures for books, \$3,000. Demarchus C.

Brown, librarian, was appointed to succeed W. E. Henry, resigned. Among the improvements at the library are new shelving, which has been added at a cost of \$7,500.00, and a workroom for reference workers. In August, 1906, the Legislative Reference Department, under Clarence B. Lester, began work. The department will collect material to be consulted particularly by members of the State Legislature. Another new department in the State Library is that of Indiana Archives, which was opened in November. The work of this department is to collect and organize all material relating to Indiana history. The State Library now has a fairly large collection of books for the blind, which may be used as a loan library and is proving of great value.

Jeffersonville, Clark County.—Population, 10,774. Township Public Library. Carnegie building, cost \$16,000, completed in 1906. Number of volumes, 4,919; additions, 1,083; new borrowers, 553; circulation, 21,584; total income, \$2,056.64; annual expenditure for books, \$927.06. Miss Bertha Poindexter, librarian, attended the Indiana Library Commission summer school. A card catalog was completed last summer. Miss Cox and Miss Griffith, graduates from Winona Technical Institute Library School, did three weeks' practice work on the catalog, and by request of the Library Board they were then asked to remain longer to complete that work.

Jeffersonville, Indiana Reformatory Library.—Number of volumes, 3,868; additions, 364; circulation, 69,711; total income, \$500; annual expenditure for books, \$400. The library has been completely reorganized under the supervision of the State Organizer of Libraries. Many books deemed undesirable were discarded, many were rebound and the entire collection of books was put under the Dewey classification. The delivery of books occurs every day, instead of twice a week, as formerly. As the men are in their cells from 5:30 to 9:00 p. m., they have every opportunity for reading. An effort is being made to have those who attended the schools to make use of the books in collateral reading. G. B. Asbury, Superintendent of Schools, is the librarian, and is thoroughly interested in making the library of the greatest value to those in the Reformatory. Two inmates assist him in the library's management.

Knightstown, Henry County.—Population, 1,942. Number of volumes, 1,800; annual expenditure for books, \$273.40. Library is supported by taxation and gifts. It was organized in 1906, through the efforts mainly of Knightstown club women, who formed a library association to foster a library movement. Mrs. Johnson, secretary of the association, was made librarian. Miss Nannie C. Jayne of Mt. Vernon, a graduate of the Winona Technical Institute Library School, assisted the librarian in cataloging the books.

*Knightstown, Indiana Soldiers' and Sailors' Orphans' Home Library.—The library was reorganized entirely when Miss Belle Roberts, an Indiana Library Commission summer school student, was engaged to take charge of the work. She performed a most efficient service in making the library of great use to the girls and boys. Miss Campbell, also a Library Commission summer school student, succeeded Miss Roberts, but her health failing, she was succeeded by Miss Margaret Deming, a student at the Indiana Library Commission summer school, and at Chautauqua. Miss Deming is making efforts to strengthen the reference department of the library.

Kokomo, Howard County.—Population, 14,000. Carnegie building, cost \$32,000. Number of volumes, 11,465; additions, 500; number of periodicals, 54; total income, \$3,100. Miss Edith Trimble, librarian, is a graduate of the Winona Technical Institute Library School. The meetings of the Indiana State Library Association in 1906 were held at the Kokomo Library last October, where every preparation was made by the local committee and the librarian to contribute to the success of those meetings.

Lafayette, Tippecanoe County.—Population, 18,116. Library occupies a residence building presented by Mrs. W. F. Reynolds. Number of volumes, 20,800; additions, 534; new borrowers, 795; circulation, 65,849; total income, \$4,092.26; annual expenditure for books, \$321.67. Limited access. Mrs. Virginia Stein is librarian. With a small expenditure of money, the spacious rooms of the house would give every opportunity to make an attractive and usable library building.

Lafayette, Purdue University Library.—Number of volumes, 16,578; additions last year, 1,229; number of periodicals, 260;

circulation, 7,909; annual expenditure for books, \$1,394.38. The library has an excellent collection of books, and in the means provided for their accessibility and use, few libraries can surpass Purdue. The collection of public and State documents is a notable one, and the number of reports from institutions is unusually large. Heavy demands are made on the library by the University, and a new library building is badly needed. The present location in one of the old buildings separates departments, crowds thousands of volumes into the basement, and prevents the best arrangement of books for the most convenient and successful use. William M. Hepburn, librarian, is a graduate of the New York State Library School.

Laporte, Laporte County.—Population, 10,000. Building, which cost \$10,000, was erected by the Laporte Library and Natural History Society. Number of volumes, 12,331; additions, 1,529; new borrowers, 842; circulation, 28,341; total income, \$2,503.33; annual expenditure for books, \$377.65. Jennie B. Jessup, librarian.

Lebanon, Boone County.—Population, 5,000. Carnegie building, cost \$15,000. Number of volumes, 2,679; additions, 1,490; new borrowers, 1,006; circulation, 17,207; total income, \$1,745.05; Mr. R. H. Harney, former county superintendent of schools, had special instruction under direction of the Indiana Public Library Commission. Miss Campbell, substitute, has been a student at the Indiana Library Commission summer school. The books in this library are well selected.

Logansport, Cass County.—Population, 20,000. Carnegie building, cost \$35,000. Number of volumes, 16,840; circulation for the year, 35,758. Elizabeth McCullough, librarian, has received library instruction at the Chautauqua summer school. Miss Rauh and Miss Stevens, assistants, have attended the Indiana Library Commission summer school. Judge Biddle's library of 8,000 volumes, many of which are old and rare, have been purchased by the Logansport Library and are now being classified and cataloged.

Marion, Grant County.—Population, 25,000. Carnegie building, cost \$50,000. Number of volumes, 4,709; additions, 1,344; new borrowers, 1,367; circulation, 61,206. Ida R. Gruwell, librarian, has had instruction with the Wisconsin Library Commis-

sion. Miss Springer, assistant, has attended the Indiana Library Commission summer school.

Michigan City, Laporte County.—Population, 14,850. State Prison Library. Number of volumes, 4,000; total income, \$4,500. The Library Commission recommends that this library follow the example of some other State institutions, and through reorganization, be made more available and useful to the prisoners.

*Monticello, White County.—Population, 2,107. Building cost \$10,000. Number of volumes, 1,646; additions, 368; new borrowers, 118; circulation, 7,798; total income, \$1,060; annual expenditure for books, \$309.25. Nora G. Gardner, librarian. A large number of unbound volumes of magazines and good picture books have been given to the library. They are kept in the reading-room, and the magazines are used extensively for reference work. The library is a center of club activity. Among the organizations which meet there are the University Club, and the Winona Club. A number of the ladies meet once a week at the library for informal reading and to use the reference books. The clubs of Monticello have formed a "Local Union of Clubs" and will supply the furnishings of the new library building when it is finished. The librarian has a story hour for children and has done successful work with picture bulletins and posters. She reports "More boys spend their time in our library than girls. They read better books and are decidedly more interesting. A little crowd of boys have been reading Scott and Dickens this summer with real pleasure." The librarian is anxious to co-operate with farmers' wives in selection of books for their reading, and this desire was strengthened as a result of a farmers' institute at Monticello, when the discussion of reading on the farm was led by the State Organizer of Libraries.

Moore's Hill, Dearborn County.—Population, 338. Moore's Hill College Library. Number of volumes, 5,260; additions, 250; new borrowers, 275; total income, \$200; annual expenditure for books \$75.00. C. E. Torbet, librarian. The Commission's Instructor, Miss Phelps, supervised the recataloging of the library. The college is anxious to engage some librarian who will take charge of the library work in exchange for a college course.

Mt. Vernon, Posey County.—Population, 5,132. Alexandrian Library. Carnegie building, cost \$12,500. Number of volumes.

2,300; new borrowers, 774; total income, \$1,354. Mrs. Ollie McGregor Smith, librarian, has had instruction at the Indiana Library Commission summer school. Mrs. Alexander, the generous benefactor of the library, died last spring. She had a large part in reorganizing the library from a struggling one, which she maintained by personal work and sacrifice, through its initial development. She donated a valuable piece of real estate to the library and the gift of Mr. Carnegie has put the library on a good financial basis. Miss Sue Dodd cataloged the library and assisted Mrs. Smith in getting the library building in proper running order.

Muncie, Delaware County.—Population, 31,606. Carnegie building, cost \$55,900.85. Number of volumes, 20,859; additions, 2,325; new borrowers, 1,934; circulation, 66,525; total income, \$7,346.57; annual expenditure for books, \$3,206.16. Arlena M. Chapin, librarian, had library instruction at the Armour Institute. The library has done extensive and efficient work with schools. Reading lists have been compiled on all holiday and special days; visits have been made to the schools by the children's librarian and printed slips have been distributed at schools. Two hundred books have been sent to the Avondale Township school for the use of that school exclusively, and the high school library has been completely cataloged. Successful work has been done with clubs and references have been furnished in advance, as far as possible. Miss Streeter and Miss Hurd, assistants, have attended the Indiana Library Commission summer school. The Muncie library entertained the Indiana Library Association a year ago most successfully. The Muncie library is regarded as one of the strongest libraries in Indiana, and one of its great elements of strength is in its efficient library board, the members of which are tireless in improving the library. Library institutes have been held at the Muncie library, one of which was addressed by Miss Ida Mendenhall of the Library Commission office. Women's clubs in Muncie are strong supporters of the library, and at a recent club meeting the State Organizer of Libraries and Miss Chapin gave addresses on library development.

New Albany, Floyd County.—Population, 21,000. Carnegie building, cost \$40,000. Number of volumes, 12,496; additions, 1,087; new borrowers, 1,366; circulation, 53,986; total income, \$6,408.62; annual expenditure for books, \$1,350.94. Annette L.

Clark, librarian, has attended the Indiana Library Commission summer school. The library is being put into fine shape. Miss Clark, formerly a teacher in the New Albany schools, succeeded Walter Harrison as librarian. Miss Mendenhall, of the Library Commission office, spent several days in New Albany getting the children's work on a good working basis. One of the features of her work was the addresses to teachers.

New Harmony, Posey County.—Population, 1,600. Workingmen's Institute Public Library. Building, the gift of Dr. Edward Murphy, cost \$24,000. Number of volumes, 17,000; additions, 1,100; total income, \$6,763.48; annual expenditure for books \$962.77. The library support is from its endowment. Arthur Dransfield is the librarian. It is a cause of regret that the Library Board of New Harmony was not able to carry out its plans for reorganization through accessioning, classifying and cataloging the library. The collection of books at New Harmony is among the most valuable in Indiana. The valuable information regarding it acquired by Mr. Dransfield through his long period of service would be most desirable if put in some available form. The collection of 17,000 volumes is rendered almost useless to school children through the lack of modern library appliances.

Peru, Miami County.—Population, 8,463. Carnegie building, cost \$25,000. Number of volumes, 5,547; additions, 936; new borrowers, 329; circulation, 23,235. Gertrude Thiebaud, librarian, has had library instruction at the Indiana Library Commission summer school. She succeeded Miss Shirk as librarian. The Peru library is doing exceedingly satisfactory work. It is particularly successful in its work with children, which work includes story hours. Chairs made especially for children have been provided, with other comforts. Entrance to colleges is encouraged by the display of college catalogs and other announcements. Special attention is given to high school debates. The subjects for debate are posted on the library bulletin board, with lists of reference for debaters. Portraits of the successful contestants are posted after the debates.

Plainfield, Hendricks County.—Population, 1,000. Building cost \$1,800. Number of volumes, 1,526; additions, 208; new borrowers, 129; circulation, 5,310; total income of \$360.33 is from

gifts and taxation. Melissa Carter is librarian. The Plainfield library is in fine condition. The library movement was started by an association of women, who rented a small storeroom and organized a public library and reading-room. All classes of citizens were interested in the library movement. One man gave lumber, another his services and built book shelves; one firm gave wall paper, and several women hung the paper on the walls. Odd pieces of furniture were given by many, the Library Commission loaned traveling libraries, and a good start was made. Later, the Library Commission advised reorganization, and following the incorporation of the town, this was done, the library being reorganized under the laws of 1901-03. This was after the Library Association had, by its own efforts and co-operation with citizens, secured a desirable building site and erected an attractive library building. Miss Nina Almond, a graduate of the Winona Technical Institute Library School, rendered valuable practice service at Plainfield, in making a card catalog for the library.

Plainfield, Hendricks County.—Indiana Boys' School Library. Realizing that the library had not received the attention which its educational value deserved, the Board of Control of the school asked the last Legislature for \$500 for new books, which was granted. Upon invitation of the Board, the Library Commission gave assistance in the selection of the books which have now been purchased. The State Library Organizer was invited to visit the school and submit a report on library conditions there, and suggestions as to their improvement. The State Organizer recommended changes in the library, which would greatly add to its convenience and attractiveness. New shelves and better tables were suggested, as well as the entire reorganization of the library with accession records, classification, card catalog, shelf list and a simple charging system. Special reading lists and illustrative bulletins to encourage reading of nature books, biography, history and travel were suggested. It was recommended, also, that the living rooms in several dormitories be made more inviting and that tables be provided, so that the boys will be encouraged to do more reading in their own houses. While the work of reorganization is in progress the Library Commission offers to provide eight or more traveling libraries for the boys' use in their own dormitories. The Library

Commission has volunteered to supervise the library reorganization at the school, and this offer was gladly accepted by the Board of Control.

Plymouth, Marshall County.—Population, 4,000. Public School Library. Number of volumes, 5,084; additions, 69; new borrowers, 35; total income, \$51.27. Limited access. The books in this library were shelved in a peculiar manner when seen by the State Organizer. Each book was kept in a separate compartment or pigeon hole, and was laid in the compartment on its side. C. A. Randall, librarian.

Poseyville, Posey County.—Population, 800. Carnegie building, cost \$5,000. Number of volumes, 600; additions, 55; total income, \$1,115.56; annual expenditure for books, \$169.05. Caroline Elliott, librarian. Through the effort of the members of the women's clubs, Epworth League and individual citizens, the Poseyville library was organized. It was located at first in an office building. The president of the Board took great interest in young people's reading, and at his own expense he furnished reading tables and many books. This interest continued, and aided by other members of the Library Board and a donation of \$5,000 from Andrew Carnegie, the library building was erected. Miss Phelps, the Library Instructor at that time, gave personal attention to the technical work at the library, and at its dedicatory exercises the State Organizer of Libraries spoke on "The Relation of the Library to the Community."

Richmond, Wayne County.—Population, 18,226. Morrison-Reeves Township Library. Organized in 1864. Building was erected from gifts and cost \$50,000. Cutter system of classification; number of volumes, 34,149; additions, 2,275; new borrowers, 1,022; limited access; circulation, 64,837; total income, \$8,702.12; annual expenditure for books, \$2,204.32. Ada L. Bernhardt, librarian. Miss Florence Fox, a graduate of the Wiona Technical Institute at Indianapolis, has rendered special service in the library.

Richmond, Wayne County.—Earlham College Library. The college has complied with Carnegie conditions and \$30,000 are now available for a new library building, the plans for which show a building of unusual promise. The present library quarters, al-

though crowded with 13,000 volumes, have an excellent library atmosphere. Harlow Lindley, librarian, has arranged during four years, that one of his assistants has received library instruction at the Indiana Library Commission summer school, and he has then given attention to their practice work. An impetus was given library conditions at Earlham by the Library Commission in 1905, when Miss Mendenhall of the Commission's force, gave an instructive course at the college on library and school co-operation.

Rising Sun, Ohio County.—Population, 1,684. Mahlon Brown Public School Library. Number of volumes, 1,435; additions, 35; circulation, 1,320; annual expenditure for books, \$26.20. Elizabeth Marble, librarian, has had instruction at the Indiana Library Commission summer school. Over fifty years ago Mahlon Brown, then a resident of Rising Sun, made a will, leaving a "contingent remainder" of his estate to be used for the education of indigent children of Rising Sun. The will was made before public school education was well established in Indiana. In the course of years there was made available under the terms of the will, \$1,800, and in 1899 Mr. Joshua Spencer, the mayor of Rising Sun, obtained a decree of court authorizing the expenditure of this money to establish a public library on the ground that the children of Rising Sun were not properly educated unless they had access to a collection of books. The books were most carefully selected and placed under the Dewey system of classification, the State Organizer supervising some of the work. The library has rendered valuable service to the children of Rising Sun, but as was inevitable, many of the books need repairing and there is a sad lack of new material, as the town has made no provision for the library.

Rochester, Fulton County.—Population, 3,421. Number of volumes, 1,430; additions, 540; new borrowers, 512; circulation, 12,508; total income, \$2,215.88; annual expenditure for books, \$586.35. Iva Etta Sullivan, librarian, had instruction at the Indiana Library Commission summer school. Interest in a public library was started by the women's clubs of Rochester. Mrs. Sara Shafer, at present the president of the Library Board, invited club members and interested citizens to meet the State Organizer of Libraries at her home, when plans were discussed for presentation at a public library meeting. This was held at the court house,

and after a frank discussion it was voted to organize a public library. The library has purchased special collections and lists of books for the use of the two literary clubs. Other books have been purchased for use of high school students, farmers and fruit growers in the township. Lists of books have been sent to the different township schools and farmers' institutes. Dr. Spohn, a former citizen of Rochester, bequeathed \$3,000 to be used in yearly installments of \$500 for the purchase of books. The library will be moved into the new \$15,000 Carnegie building at an early date.

Saint Meinrad, Spencer County.—Population, 300. St. Anselm's Library. Number of volumes, 20,000; additions, 200. Rev. Albert Kleber, librarian. Library is in charge of the Benedictine Order. A few fathers of this society emigrated to Southern Indiana in 1854 and founded a monastery and library in Spencer County. The library is particularly strong in bibliology, patrology and ecclesiastical history. Books printed in Latin and German predominate, followed by those in English, Italian, Greek, French and Hebrew. The library has a few codices which date from 1593, and a large number printed in the seventeenth and eighteenth centuries. The system of classification is based on that used in the Library of Munich. While the library is used primarily by the college and the seminary at St. Meinrad's Abbey, any student who "presents a genuine confidential guarantee of good faith" may have access to its shelves. Father Kleber visited the Commission office to obtain suggestions as to a reclassification of the library.

Salem, Washington County.—Population, 2,400. Carnegie building, cost \$17,000. Number of volumes, 3,000; new borrowers, 266; circulation, 10,705; total income, \$1,400. Jessie Lee Wilson, librarian, has had library instruction at the Indiana Library Commission summer school. The library was organized in 1902. Following a farmers' institute, when the State Organizer of Libraries spoke on "Home Reading," the Fortnightly Literary Club requested the State Organizer to confer with it on the organization of a public library. As a result it was voted to establish a library under the law of 1901-03, and a vacant flour and feed store was secured for library purposes. The shelves were used for books and the counter for delivery desk and for reading tables. Miss Wilson was appointed librarian. A gift of \$17,000

was afterwards secured from Andrew Carnegie for a library building, which was opened to the public in 1905. People in the country may retain books for two weeks unless the books are recent fiction. Teachers using books in their school work may keep them as long as needed.

Seymour, Jackson County.—Population, 6,445. Carnegie building, cost \$10,000. Number of volumes, 2,509; additions, 647; new borrowers, 1,049; circulation, 18,830; total income, \$1,042.85; annual expenditure for books, \$379.33. Pearl M. Clark, librarian. After several visits from the State Organizer the library was reorganized in 1904, and when the new building was completed the books were removed from a second story office room to the commodious new quarters. When last visited the library was in need of better classification.

Shelbyville, Shelby County.—Population, 8,517. Carnegie building, cost \$20,000. Number of volumes, 9,100; total income, \$3,000. Ida Lewis, librarian. The Shelbyville library is in good condition and is doing effective work. It is emphasizing the value of work in domestic economy at present, and has purchased many new books on this subject. Miss Lewis afforded excellent practice work in her library to Miss Ada Bonnell, prior to Miss Bonnell beginning work in the Vincennes Public Library.

*South Bend, St. Joseph County.—Population, 40,327. Building erected by a tax levy and cost \$31,000. Number of volumes, 13,966; new additions, 787; new borrowers, 996; circulation, 49,943; total income, \$5,421.14; annual expenditure for books, \$901.89. Virginia Tutt, librarian, had instruction at the Indiana Library Commission summer school. Upon advice of the Library Commission this library has been reclassified and has been card cataloged by an expert. Miss Tutt, who had been an assistant in the library, became librarian on the resignation of Miss Humphreys. Miss Edna Longley, assistant, has completed the course at the Winona Technical Institute Library School. The library has recently opened an attractive children's room on the second floor. Special furniture has been provided, books bought and an excellent plan of work with children has been outlined.

Spencer, Owen County.—Population, 2,026. Public library organized in 1906, after a public meeting. Library tax assessment levied and desirable quarters in the city building were secured.

Most of the funds on hand were devoted to the librarian's salary, upon advice of the State Organizer of Libraries, and a large number of desirable books were secured through a book shower given by the Library Board in the library rooms. Many former residents of Spencer were asked to contribute books, and the many secured in this way, as well as all other books, were given bookplates with the name of the donor. Aggressive library work is being planned for the coming year.

Spiceland, Henry County.—Population, 300. Spiceland Academy Library. Number of volumes, 3,000; H. H. Cooper, librarian. At the request of the principal of the Academy, the State Organizer superintended the reclassification of the library, which was done with the assistance of the teachers. A number of citizens of Spiceland wish the library reorganized so that it may become the nucleus of a larger public library, and the entire community have the benefit of a public library and reading-room.

Sullivan, Sullivan County.—Population, 3,118. Carnegie building, cost \$10,000. Number of volumes, 2,091; new borrowers, 1,046; circulation, 11,628; total income, \$1,211.16; annual expenditure for books, \$883.58. Julia Mason, librarian, is a graduate of the University of Illinois Library School. The new library building was secured mainly through the efforts of club members of Sullivan. The Public Library Commission gave advice concerning the organization under the law of 1901-03 and inspected the building plans, the State Organizer appearing upon the dedicatory program. Splendid manual training work is being done in the Sullivan public schools which affords the library an excellent opportunity for work in this field.

Terre Haute, Vigo County.—Population, 40,000. Emeline Fairbanks Memorial Library. Building erected by Crawford Fairbanks at a cost of \$75,000. Number of volumes, 19,914; circulation, 51,098; total income, \$18,135.32; annual expenditure for books, \$2,136.09. Mrs. Sallie C. Hughes, formerly assistant librarian, was appointed librarian to succeed Miss Leatha Paddock, who resigned last April. The new library building is an unusually handsome one and commodious new quarters will permit of carrying forward plans for new work. Closer co-operation of the library with schools, children's work, bulletin work, and more extensive work with clubs and in the reference department are

contemplated. The Library Commission has recommended that the library be recataloged and that more modern library appliances be introduced. Miss Grace Davis and Miss Florence Crawford, assistants, have received library instruction at the Indiana Library Commission summer school.

Terre Haute, Vigo County.—Population, 40,000. Indiana State Normal School Library. Building erected by the State, cost \$75,000. Number of volumes, 40,127; additions, 2,600; total income, \$9,221. Arthur Cunningham, librarian. This is a splendid reference library and extensive picture collections are used in its work. Appropriation for a new building was asked of the Assembly of 1907.

Tipton, Tipton County.—Population, 5,000. Carnegie building, cost \$12,000. Number of volumes, 3,000; additions, 610; new borrowers, 236; circulation, 7,790; total income, \$1,300. The library was organized chiefly through the efforts of Mrs. Sam Matthews, who is the present librarian, and who has always taken the liveliest interest in the library's work. The library building is generally considered as one of the best Carnegie buildings in the State for its cost. Advice has been asked of the Library Commission by the Tipton Library Board and librarian, and lists and bulletins have been sent, pictures selected and help given in the arrangement and furnishing of the library building.

Union City, Randolph County.—Population, 2,616. Carnegie building, cost \$10,000. Number of volumes, 1,681; additions, 486; new borrowers, 225; annual expenditure for books, \$227.07. Susan R. Weimer, librarian, has attended the Indiana Library Commission summer school. Mr. Hines, then superintendent of schools in Union City, was the prime mover in establishing the library. He enlisted the support of the Library Commission, and at a citizens' meeting at the Union City opera house, it was voted to organize a library, after an address by the State Organizer of Libraries. The club members of the city have been closely identified with the library and have contributed money and furniture for its use. The Public Library Commission through the State Organizer gave information regarding essentials in good library building construction. The Union City library was placed in a city park.

Valparaiso, Porter County.—Population, 6,280. Valparaiso

University Library. Number of volumes, 12,000. Library is supported from university funds. Ella Porter, librarian. All the books are under the care of Miss Porter, whose efficient service has covered a period of eighteen years. The library requires a good system of classification and card indexing to teach the students the use of library appliances and to permit them to help themselves in a large library. Miss Mendenhall, of the Indiana Library Commission's force, conducted a course of work on library and school co-operation at the university with most successful results.

Vincennes, Knox County.—Population, 15,000. Total income, \$1,500; annual expenditure for books, \$150. Miss Lillie Trimble, librarian, has attended the Indiana Library Commission summer school. Miss Hindman, assistant in the library, has also attended the summer school. The library was reclassified and cataloged under the direction of Miss Mabel Bonnell. Recently additional room was granted the library, which will permit it to undertake more aggressive work for the public than has been possible heretofore.

Wabash, Wabash County.—Population, 8,618. Carnegie building, cost \$20,000. Number of volumes, 5,299; additions, 513; new borrowers, 345; circulation, 22,169; total income, \$2,000; annual expenditure for books, \$542.72. Miss Daisy Henley, librarian, has attended the New York State Library summer school, Indiana Library Commission summer school and the Wisconsin Library Commission summer school. Before its present organization, a reading room was maintained by the Round Table Club of Wabash, whose members took charge on certain days. Later the collection of books was combined with the High School Library, and the library was reorganized in 1901, with Warren Bigler as president of the library board. The Library Commission gave assistance when the new building was erected. Effective work is being done along many lines, notably with clubs and schools. Miss Henley, the librarian, assisted in the reorganization of the Attica library.

Warsaw, Kosciusko County.—Population, 4,000. Number of volumes, 3,593; additions, 23; total income, \$108. Ethel G. Baker, librarian, has attended the Indiana Library Commission summer school. The library is under the care of the Warsaw school board.

During the last year Miss Baker, assisted by Miss Goddard, made a card catalog of the library. The Ten Thousand Club of Warsaw asked the State Organizer to confer with it regarding the library's reorganization, and in an attempt to secure a Carnegie building, which Warsaw is well able to support. It is probable that this will be pushed to a conclusion in the near future.

Washington, Daviess County.—Population, 8,000. Carnegie building, cost \$22,000. Number of volumes, 5,537; additions, 629; new borrowers, 387; circulation, 21,155; total income, \$3,628.03; annual expenditure for books, \$825.58. Mrs. A. H. Gibson, librarian, has had special instruction with the Indiana Library Commission, and later attended the Indiana Library commission summer school. The Commission, through the State Organizer, gave advice in the library's reorganization and regarding the library building plans. The State organizer conferred with Mr. Hamlet Allen, principal of the Washington High School, regarding the library, and the high school library, with the exception of reference books, has been turned over to the public library. The library site was donated to the library by a public-spirited family of Washington, and while of good size, it is too near the railroad station, which makes the library's administration somewhat difficult. Mrs. Gibson, librarian, is doing efficient work with clubs and schools, and is assisted by her daughter, who has had the course at the Indiana Library Commission summer school.

Westfield, Hamilton County.—Population, 670. Number of volumes, 1,207; additions, 148; new borrowers, 113; circulation, 5,877; total income, \$249.43; annual expenditure for books, \$121.08. Library supported by taxation and entertainments. Belle Roberts, librarian, has attended the Indiana Library Commission summer school, and her assistant, Hazel Bray, has had instruction at the summer school. The women of Westfield have been vitally interested in the public library from the start. After visits from the State Organizer, the library was established in a store room for which \$50.00 a year was paid. Ida Roberts did most valuable service as librarian, so that its patronage is large and loyal. The library board soon purchased its own library property, and upon Miss Ida Roberts' resignation to re-enter missionary work among the Indians, her sister was appointed to suc-

ceed her. The township advisory board agreed to co-operate with the library board in the library's support, but this support was afterwards withdrawn, but has been promised for the coming year.

Whiting, Lake County.—Population, 3,983. Carnegie building, costing \$23,000, in course of erection. Number of volumes, 503; new borrowers, 594; circulation, 11,473; total income, \$5,800.82; annual expenditure for books, \$1,637.50. Florence S. Wing, librarian. Through a circular letter issued by the president of the Public Library Commission, which set forth the advantage of a public library, the superintendent of the Whiting schools communicated with the Public Library Commission and then arranged for a public meeting to discuss the desirability of a public library in Whiting. The Mayor, members of the Council, clergymen and citizens in general responded, and the State Organizer of Libraries was called upon to explain the public library laws of 1901-03. It was then voted to establish a public library and a ways and means committee was appointed to confer with the State Organizer of Libraries. The library was organized in 1904 and occupied a rented store building. A site was afterwards donated and a gift of \$23,000 was received from Andrew Carnegie for a building. Trained library service was recognized as of great importance and Miss Mary Shaefer, a graduate of the University of Illinois library school, was appointed librarian. Upon her resignation she was succeeded by Miss Florence Wing.

Winamac, Pulaski County.—Population, 1,800. Number of volumes, 1,042; additions, 113; new borrowers, 323; circulation, 1,862; total income, \$165.67; annual expenditure for books, \$62.02. Joanna O'Connell, librarian. Through the efforts of W. H. Kelly, superintendent of the Winamac schools, the library was established in the high school building. Upon request, the State Organizer of Libraries assisted in the classification and cataloging of the library. In 1905 the women's clubs of Winamac became interested in reorganizing the library, and after a visit of the State Organizer, reorganization was effected. The library was moved from the high school to the court house and was placed in charge of Miss O'Connell. The Library Commission's instructor spent a week in getting the collection of books ready for circulation.

INDIANA LIBRARY LAW.

(Acts 1901, p. 81, approved and in force March 4, 1901. Acts 1903, p. 301; amendments approved March 9, 1903.)

Section 1. Be it enacted by the General Assembly of the State of Indiana, That the Common Council of any city or the Town Board of any incorporated town within this State desiring to establish, increase and maintain a public library in such city or town, open to and for the use and benefit of all inhabitants thereof, may levy a tax annually of not to exceed one mill on each dollar of all taxable property assessed for taxation in such city or town as shown by the tax duplicate for the year immediately preceding the fixing of such levy, which tax shall be placed on the tax duplicate of such city or town and collected in the same manner as other taxes are levied and collected, and such levy shall be certified to the clerk of the Circuit Court. If the Common Council of such city, or the Town board of such incorporated town, do not make such levy, they shall do so at the next ensuing levy, and annually thereafter, after taxpayers of such city or town raise by popular subscription for each of the two years immediately following the date of completion of such subscription, a sum of money equal to the amount that would be derived from a tax levy of two-tenths of a mill on each dollar of the taxable property assessed for taxation in such city or town, as shown by the tax duplicate immediately preceding the completion of such subscription: Provided, That no more than two per cent. of the entire amount necessary to be subscribed shall be subscribed by any one person, firm or corporation of such city or incorporated town. The amount of money so subscribed as herein provided, for library purposes, shall be made to fall due and be payable in eight equal quarterly installments. The first installment shall become due and payable on the first Monday of the second month following the date of the completion and filing of such subscription, as hereinafter provided, and one installment shall become due and payable on the first Monday of each third month thereafter, till all of such subscription is paid. The subscription shall be collected by the Public Library Board, hereby created, as hereinafter provided.

Sec. 2. The subscription list for said money shall be filed with the clerk of the Circuit Court of the county in which such city or incorporated town is located. The said clerk of the Circuit Court immediately thereafter shall notify the judge of the Circuit Court of said county that such subscription has been filed, and he shall likewise notify the Common Council or Town Board and the Board of School Trustees of such city or town proposing to establish a public library, that said subscription has been filed. The original subscription list shall be preserved by the clerk of the Circuit Court and by him placed in the hands of the Public Library Board, when the Board shall have been appointed as hereinafter provided.

Sec. 3. Within ten days after said judge of the Circuit Court shall have been notified, as above provided, that such subscription list has been filed with the clerk of the Circuit Court, if one has been filed to secure the levying of such tax, or that the Common Council has certified to such clerk that the levy as provided herein has been made, it shall be the duty of said judge to examine such subscription list and if it be found that an amount of solvent subscription has been made equal to the amount required by Section 1 of the above entitled act, then he shall order a copy of such subscription list spread upon the records of said court; and he shall appoint three persons, resident of such city or town, as members of such Public Library Board, one of whom he shall appoint for one year, one for two years and one for three years from the date of their appointment, and all appointments so made by the judge of the court shall be entered in the order books of said court. Within ten days after the Common Council or Town Board and the Board of School Trustees shall have been notified, as in Section 2 of the above entitled act, each body shall appoint two persons all residents of such city or town, not otherwise appointed as members of such board, who shall become members of such Public Library Board. The members so appointed by the Common Council or Town Board for the first appointment under this act shall serve for a period of one year, and after the first appointment all appointments made by the Common Council or Town Board shall be for a period of two years. The Board of School Trustees shall appoint its members for a term of two years who may be from their own board. If the Township Advisory Board of the township in which such library is located shall levy and collect two-tenths of a mill on each dollar of all the taxable property assessed for taxation in said township, as shown by the tax duplicate for the year immediately preceding the fixing of such levy exclusive of the property of such city or town already taxed for said library and collect and pay the same over to the treasurer of such city or town where such library is located, then in such case the township trustee shall, ex officio, be a member of such Public Library Board, and such township trustee shall appoint one person, a resident of said township, not otherwise appointed, as a member of said Public Library Board, who shall become a member of such Public Library Board, and such appointment by such township trustee shall be for a period of two years, and all members of such Public Library Board appointed as herein provided, shall serve until their successors are appointed and qualified: Provided, That women may be eligible to appointment as members of such Library Board, and not less than three of the members appointed shall be women. The judge, Common Council or Town Board, the Board of School Trustees, and Township Trustee, in making the appointments, shall select persons of well-known probity, integrity, business ability and experience, and who are fitted for the character of the work they are to perform, and who shall have resided for a period of not less than five years, immediately preceding their appointment, in the city or town for which they are appointed, in the case of members appointed by the judge, Common Council or Town Board and School Trustees, and in the township in the case of the member appointed by the Township Trustee as hereinbefore provided, and who shall not be less than twenty-five years of age at the time of appointment, and who

shall serve without compensation for services. In case of vacancy on such board from any cause, it shall be the duty of said judge, Common Council or Town Board, Board of School Trustees and township trustees to fill such vacancy occurring in the membership appointed by each respectively.

Sec. 4. All appointments to membership on the Public Library Board shall be evidenced by certificates of appointment duly signed by the judge as to members appointed by him, by the mayor or president of the Town Board, the president of the Board of School Trustees and the township trustees as to members respectively appointed by them, which certificates of appointment shall be handed to or mailed to the address of the appointee. Within ten days after receiving such certificates of appointment such appointees shall qualify by taking the oath of office before the clerk of the court that such appointee will faithfully discharge the duties as member of the Public Library Board to the best of his ability, and shall file such certificate, with the oath endorsed thereon, with the clerk of the Circuit Court of the county in which such Library is to be established.

Sec. 5. Within five days after all the members of such board shall have been appointed and qualified they shall meet and organize by electing one of their number president, one vice-president and one secretary, and shall select such committees or executive board as they may deem necessary to carry on the work of the board.

Sec. 6. The seven members thus appointed shall constitute and be known as a Public Library Board, and shall have the control of the Public Library funds and the custody and control of all of the books and other property of every name and description, and shall have the power to direct all of the affairs of said Public Library; and such Public Library Board, in the name of the Library, shall be empowered to receive donations, bequests and legacies, and to receive and convey real estate for and on behalf of such library, and shall be entitled to receive from the Public Library Commission copies of all documents and publications of the State available for distribution. They shall have the power to make and enforce rules for the management of such libraries as they may deem necessary, and to employ librarians and assistants.

Sec. 7. When such Public Library Board shall have organized for the transaction of business, there shall be placed in its hands by the Clerk of the Circuit Court the original subscription list, if any has been made for the procuring of the levy of the tax as herein provided, and it shall be the duty of such Library Board to collect quarterly all money subscribed, as the same becomes due, as provided for in section 1 of this act, and pay the same over to the treasurer of such town or city, and to expend the same in the establishment, equipment, enlargement and management of a Public Library in the manner as provided for in section 8, which shall be open to and for the use and benefit of all the inhabitants of the city or town in which the same is located, and such Library Board may use such sum for the purchase of a building site and the erection of a library building, as the Board may decide. It shall be the duty of such Library Board to determine the rate of taxation that shall be necessary to establish, increase, equip and maintain the Public

Library and certify the same to the Common Council or Town Board and the County Auditor: Provided, That said levy shall not exceed one mill on each dollar of all the taxable property assessed for taxation in such city or town, as shown by the tax duplicate for the year immediately preceding the fixing of such levy. When the assessment for such Public Library purposes shall be certified to the Common Council or Town Board and the Auditor, by the Public Library Board, the same shall be placed on the tax duplicate of such county and city or town and collected in like manner as other taxes are levied and collected.

Sec. 8. The tax so levied as provided for in Sections 1 and 7 of this act shall be held and kept as a separate fund by the treasurer of such city or incorporated town for public library purposes, as herein provided, and he shall pay out of the same for public library purposes only upon the warrant of the president of the Library Board, countersigned by the secretary thereof. The treasurer of such city or town shall be liable on his official bond for the faithful performance of the duties imposed upon him by this act.

Sec. 9. When a public library shall have been established in any city or incorporated town in this State under the provisions of this act, such library shall be opened and free for the use and benefit of all the inhabitants of the township in which such library shall be located, provided that the township Advisory Board of the township in which such library is located shall levy and collect a tax of two-tenths of a mill on each dollar of all taxable property assessed for taxation in said township, as shown by the tax duplicate for the year immediately preceding the fixing of such levy, exclusive of the property of such city or town already taxed for said library and collect and pay the same over to the treasurer of such city or town where such library is located, to be held by such treasurer as a part of the public library fund. Said library shall remain open and free for the use and benefit of all the inhabitants of such township so long as said tax as herein provided and specified shall be levied, collected and paid over to the treasurer of such city or town for the use of said Library Board for the purpose herein named. When the public library of any city or town is not so opened and free for the use and benefit of the inhabitants of any township, by reason of such township failing to levy and collect the tax herein required, the Public Library Board may issue and sell certificates or library cards to any person or family resident in such township at such annual fee as may be deemed by them to be a fair compensation for such privilege, and such library cards shall give to the purchaser thereof the same rights and privileges as the inhabitants of the city or incorporated town.

Sec. 10. If any city or incorporated town in this State where a library of the value of an amount equal to the amount of money that would be derived from a tax levy of three-tenths of a mill on each dollar of valuation of taxable property within such city or town assessed for taxation, as shown by the preceding tax duplicate of said city or town, is already established and maintained under the existing laws of the State, and whenever the managing board of such library already so existing and maintained shall tender the ownership, custody and control of said library free of expense to such Public Library Board for the use

and purpose of a Public Library, as contemplated by this act, which tender of custody and control thereof shall be evidenced by a certificate issued by the managing board thereof and filed in triplicate with the Clerk of the Circuit Court of the county wherein said city or town is located, with the clerk of said city or town and the secretary of the Board of School trustees, in the manner and form as prescribed in the certificates of popular subscription contained in section 2 of this act, which certificate shall show the value of such library, a Public Library Board shall be appointed in the manner as set forth in this act, except such board shall be appointed only when the Common Council or Town Board has decided by a majority of vote of the members thereof to accept such library and to levy annually and collect a tax as other taxes are levied and collected and not to exceed one mill on each dollar of valuation of taxable property of such city or town, as herein specified. Said Council or Town Board shall certify its said decision of acceptance, attested by the Clerk of said city or town and the Mayor of such city or the President of such Town Board, to the judge of the Circuit Court and the secretary of the said Board of School Trustees, whereupon said judge, City Council, or Town Board and Board of School Trustees shall proceed to appoint said Public Library Board in the manner and form and to all intents and purposes as is done by the voluntary levy of such tax by the Council or Town Board, or the popular subscription filed with the clerk of the court as hereinbefore provided.

Sec. 11. The judge of the Circuit Court, the Common Council or Town Board and the Board of School Trustees may at any time, for cause shown, remove any member of such Library Board that may have been appointed by each, respectively, and fill the vacancy occasioned thereby as provided for in Section 3 of this act.

Sec. 12. The treasurer of such city or incorporated town, operating libraries under this act, shall make and file with the Common Council or the Town Board thereof, not later than the 15th day of January of each year, an itemized statement under oath of all of the receipts and disbursements of such Public Library Board for the year ending December 31, immediately preceding the making and filing of such report, and such report shall contain an itemized statement of the sources of all receipts, all disbursements made and the purpose for which the same were made, and such annual reports shall be opened to inspection of the citizens of such city or town, and also the township in which such city or town is located, providing the township has complied with the provisions of Section 9, herein.

Sec. 13. All laws and parts of laws in conflict with the provisions of this act are hereby repealed: Provided, That this act shall not interfere with the maintenance or management of any existing library already established and operating under the laws of this State.

Sec. 14. Whereas an emergency exists for the immediate taking effect of this act, therefore, the same shall take effect and be in force from and after its passage.

IMPORTANT DECISIONS.

RENDERED BY THE ATTORNEY-GENERAL REGARDING PROVISIONS
IN THE INDIANA LIBRARY LAW.

APPOINTMENTS.

August 24, 1904.

Miss Merica Hoagland, Secretary Public Library Commission:

Dear Madam—In your communication of the 24th you ask:

“Under Section 5 of the library law of 1901-03, after the judge of the Circuit Court has made his appointments, should the council or the school board refuse to make its appointments, how shall such appointments be secured?”

By Section 2 of the act of 1901 it is provided that after the subscription list shall have been filed with the clerk of the Circuit Court of the county, the clerk of the court shall immediately thereafter notify the judge of the Circuit Court, and likewise the common council or town board and the board of trustees of such city or town that such subscription has been filed.

By Section 2 of the act of 1903 it is provided that within ten days after the common council or the town board and the board of school trustees shall have been notified, as provided by Section 2, each body shall appoint two persons, residents of such city or town not otherwise appointed, as members of such board.

The provisions of these sections are mandatory and if either of said bodies should refuse to comply with such provisions, they could be mandated so to do by proper legal proceedings.

ESTABLISHMENT OF PUBLIC LIBRARIES IN INCORPORATED CITIES AND TOWNS WHICH HAVE ABOLISHED THEIR SCHOOL BOARDS.

March 18, 1904.

Miss Merica Hoagland, Public Library Commission, City:

Dear Madam—In your communication of the 18th you ask whether the law providing for the organization of library boards and the establishment of libraries in incorporated cities and towns, passed by the Legislature of 1901, and amended by the act of the Legislature of 1903 (See Acts 1903, p. 301), can be applied to incorporated towns within the State, where such towns have transferred their school property to the township trustee under the statute providing therefor, and thereby discontinued and abolished their school boards.

The library act above referred to was passed by the Legislature for the purpose of enabling all incorporated towns to establish and maintain public libraries for the use of their inhabitants. The first sentence of the act is as follows: "That the common council of any city, or the town board of any incorporated town," etc.

It is a beneficent act, for the benefit of the people coming within its provisions, and, hence, should be liberally construed, with a view to effectuate the purpose of the legislature that enacted it.

Under the provisions of this act, after the preliminary steps have been taken a library board composed of three members appointed by the judge of the circuit court, residents of such city or town, two members to be appointed by the common council or the town board, and two members by the board of school trustees, shall be appointed.

This library board shall have charge and control of the library, but does not possess power to make any contract binding upon the municipality, except that it has the power to make an estimate and fix the amount of tax necessary for the maintenance of such library, which tax shall not exceed one mill on each dollar of the taxable property of such town.

All of the provisions of this act can be complied with by the class of towns mentioned in your inquiry, except that the two members for the library board, to be appointed by the school board, can not be appointed, since there is no school board to make the same; but, in view of the fact that a sufficient number of the members of such board can be appointed to constitute a quorum and majority thereof, it is my opinion that the class of towns referred to can not be deprived of the benefits of this law on account of the fact that such members can not be appointed.

A sufficient and efficient board can be secured, and all the benefits granted by the act to any town, acquired, and all of the rights of the people as fully protected, as if the full complement of the board could be secured.

It is, therefore, my opinion that towns of the class indicated can proceed under the law, and when they meet all the requirements of the law possible for them to observe, their acts will, in all particulars, be valid and binding.

TAXPAYER; SUBSCRIPTIONS; APPOINTMENTS; TAX, ETC.

August 24. 1904.

Miss Merica Hoagland, Secretary Public Library Commission:

Dear Madam—In your communication of the 23d you ask the following questions:

(1) "Does the term 'taxpayer' used in Section 1 of the act of 1901, page 81, as amended by the act of 1903, page 301, apply to those paying poll tax?"

One who pays poll tax is a taxpayer, and hence the term would apply to him.

(2) "May a subscription once written and filed with the clerk of the circuit court be withdrawn?"

Since it is held by the courts that the consideration for the contract embodied in a subscription to a public enterprise is the mutual agreement of all to pay such subscription, therefore, in my opinion, after a subscription has been filed with the clerk of the circuit court it has become such a contract that persons whose names are on such subscription list can not withdraw their names.

(3) "What is a solvent subscription?"

This is left to the determination of the judge who examines the list; but technically it is a subscription that can be collected.

(4) "If the judge finds that certain subscriptions are insolvent, may additional solvent subscriptions be filed, to make good the amount required by law?"

This also is a question for the determination of the judge passing upon the list. I can see no reason why additional subscriptions may not be filed.

(5) "After the judge of the circuit court has made his appointments, should the council or school board fail to make its appointments, how shall the committee appointed to secure library organization, proceed?"

Since, under Section 5 of the act of 1901, the board can not organize until all members of such board shall have been appointed and qualified, the board can not organize and can do nothing until the requirements of this section have been met—that is, until all the members have been appointed and have qualified.

(6) "What effect would the expiration of the time in which appointments should be made have upon the organization "

If either of the persons or bodies empowered by the act fail to make appointments within the prescribed time, they could lawfully make them after the expiration of such time.

(7) "What would be the effect of an appointee's failure to either qualify or decline appointment within the prescribed time?"

If the present appointee to the library board should fail to qualify or decline to qualify, then the person or board making the appointment should make another appointment.

(8) "Should the common council or town board fail to include the library tax fixed and certified by the library board in the tax levy, how shall the library board proceed?"

It is the duty of the common council or town board to include the tax certified by the library board in their levy. If they fail to do this until the time has passed for such act to be performed, the board can not proceed; that is, they can not collect anything. If the common council or town board should refuse to make the levy, they could be mandated to do so, if such steps were taken in time.

(9) "When a board transfers a library, what becomes of the fund derived from the library tax levy?"

If the transfer is made under Section 5, Acts 1903, and if the transfer includes the funds on hand, it becomes the property of the library board to which it is transferred.

TRAVELING LIBRARY CENTERS IN INDIANA 1904-6.

PUBLIC AND INSTITUTIONAL LIBRARIES IN INDIANA,
OCTOBER 31, 1906.

INDIANA INSTITUTION

FOR THE

Education of the Blind

SIXTIETH ANNUAL REPORT

OF THE

BOARD OF TRUSTEES AND
SUPERINTENDENT

FOR THE

FISCAL YEAR ENDING OCTOBER 31, 1906

To the Governor

INDIANAPOLIS:

WM. B. BURFORD, CONTRACTOR FOR STATE PRINTING AND BINDING.

1907.

THE STATE OF INDIANA,
EXECUTIVE DEPARTMENT,
December 31, 1906. }

Received by the Governor, examined and referred to the Auditor of State for verification of the financial statement.

OFFICE OF AUDITOR OF STATE,
INDIANAPOLIS, January 12, 1907. }

The within report, so far as the same relates to moneys drawn from the State Treasury, has been examined and found correct.

J. C. BILLHEIMER.
Auditor of State.

January 12, 1907.

Returned by the Auditor of State, with above certificate, and transmitted to Secretary of State for publication, upon the order of the Board of Commissioners of Public Printing and Binding.

FRED L. GEMMER,
Secretary to the Governor.

Filed in the office of the Secretary of State of the State of Indiana, January 14, 1907.

FRED A. SIMS,
Secretary of State.

Received the within report and delivered to the printer January 14, 1907.

HARRY SLOUGH,
Clerk Printing Bureau.

Indiana Institution for the Education of the Blind.

1906-1907.

OFFICERS.

Board of Trustees.

A. C. Pilkenton, Greenfield, Ind., President.
John F. Hennessey, Indianapolis, Ind., Treasurer.

George Wallace, Night Engineer, 24½ Kentucky Avenue.
May Murray, Laundress, 725 Dorman Street.
Frederick Seitz, Baker, Institution.

REPORT OF THE BOARD OF TRUSTEES.

HON. J. FRANK HANLY, *Governor of Indiana*:

Dear Sir—We herewith transmit, in compliance with the law, "The Sixtieth Annual Report of the Indiana Institution for the Education of the Blind," embracing the principal transactions for the fiscal year ending October 31, 1906.

In many ways we have been fortunate the past year. The health of the pupils has been excellent and their conduct commendable; the regular appropriations have been sufficient, consequently the provisions have been satisfactory; the school equipments have been improved, and the buildings are now generally in good repair.

The future will require some additional improvements. The power and heating plant is old and dangerous under high pressure, and in many ways inadequate. A new high-pressure boiler would relieve the difficulty. The new boiler would be used to move the machinery and the old boilers for heating purposes, where high pressure is not necessary. There should be an addition built on the north of the laundry, in order to remove the heavy machinery from the room now used for laundry purposes, and this would afford better opportunity for laundry work. Again, we wish to emphasize the need of the boys' dormitory. Thoroughness of supervision, the efficiency of school work and the comfort of the boys demand this building.

A summary of the itemized statistical tables in the body of this report is here given:

FINANCIAL.

The financial condition on October 31, 1906, was as follows:

Real estate	\$544,100 00
Personal	31,050 01
Total	\$575,150 01

Receipts—Appropriations, Regular—

Maintenance	\$34,000 00
Repairs	2,500 00
Industries	3,000 00
Library	500 00

Total—Regular	40,000 00
---------------------	-----------

Receipts—Appropriations, Special—

Stoker	\$750 00
Pianos	700 00

Total	1,450 00
-------------	----------

Receipts—Sales—

Broom shop	\$215 60
Cane shop	30 75
Sewing room	29 23
Miscellaneous	24 29

Total	299 87
-------------	--------

Total receipts from appropriations and sales.....	\$41,749 87
---	-------------

Expenditures—

Maintenance	\$33,994 51
Repairs	2,499 52
Industries	2,991 82
Library	499 44

Special:

Stoker	750 00
Pianos	700 00

Total	41,435 29
-------------	-----------

Balance converted into State Treasury.....	\$314 58
--	----------

PER CAPITA EXPENSES.

We give here the per capita expenses for the past ten years, based on the total enrollment, and of the maintenance of the average attendance:

1897	\$191 42	\$212 95
1898	192 80	227 36
1899	205 60	221 08
1900	196 51	202 75
1901	204 06	207 54
1902	220 07	236 95
1903	243 35	249 20
1904	231 33	271 64
1905	231 45	249 27
1906	246 82	263 50

POPULATION.

	Boys.	Girls.	Total.
Enrollment for the year.....	90	72	162
Average daily attendance.....	71.8	57.21	129.01
Present October 31, 1906.....	71	57	128

NEEDS.

For the fiscal years ending Oct. 31, 1908, and Oct. 1, 1909, the following appropriations will be necessary:

Regular—	1908.	1909.
Maintenance	\$35,000 00	\$35,000 00
Repairs	2,500 00	2,500 00
Industries	3,000 00	3,000 00
Library	500 00	500 00
Special—		
Boys' dormitory	50,000 00	
Boiler	790 00	
Stoker	850 00	
Engine	240 00	
Addition to laundry	1,200 00	

There are many other places where special appropriations could be used with advantage. We have asked for only those which seem most necessary.

Respectfully,

A. C. PILKENTON, President.

J. F. HENNESSEY, Treasurer.

L. M. DUNLAP, Secretary,

Board of Trustees.

SUPERINTENDENT'S REPORT.

Hon. A. C. Pilkenton, Hon. John F. Hennessey, Hon. Louis M. Dunlap:

Gentlemen—I herewith submit for your consideration the Sixtieth Annual Report of the Indiana Institution for the Education of the Blind, containing the data required by law, with such additional information and outlines of work as appear to be of value to the general public.

During the past fiscal year 162 pupils—90 girls and 72 boys—have been enrolled. This difference in number of the sexes is largely caused by the better accommodations furnished the girls. Before the construction of the girls' dormitory the boys and girls were about equal in number. The following is a list of all pupils enrolled during the fiscal year:

† Entered since October 31, 1906.

ATTENDANCE.

The attendance for the school year has been satisfactory. In few cases was the absence avoidable. The pupils, with commendable earnestness, were in school as much as possible.

HEALTH.

The health of the pupils has been uniformly good. Scarcely any interference with regular school work has occurred. No school could have been more fortunate than this in having little sickness.

SCHOOLS.

The schools are doing good work. The four departments closely correlate. The physical training requires from each pupil one period daily in the gymnasium in marching; in body, limb and head movements; in exercises with clubs, wands, rings and skates. It is intended to correct faulty carriage and develop as completely as possible the physical structure of the students. The Industrial Department is intended primarily to supplement and build upon the work of the gymnasium. Secondarily the purpose is to afford a trade by which the pupil may live after graduating. The music course is comprehensive. Several instruments have been added this year. This department is well supplied with instruments and is popular among the pupils. The work in the Literary Department has been satisfactory. The blind generally make good students. They give close attention and labor hard to make progress. All necessary apparatus for good work is supplied. On the whole the work of the schools has been satisfactory and a large per cent. of the pupils were promoted.

LITERARY DEPARTMENT.

A. C. EVENS, Principal, High School, Room 6—12s and 11s.
 MABEL HAUK, High School, Room 5—10s and 9s.
 OLIVE AUGHINBAUGH, Room 4—8s and 7s.
 NANNIE CRAMPTON, Room 3—6s and 5s.
 MARY CATHERWOOD, Room 2—4s and 3s.
 FLORENCE REYNOLDS, Room 1—2s and 1s.

All pupils in this Institution are in this department. Twelve years are required for graduation. A year's work is the amount suitable to an average pupil for five hours a day for nine months. The course of study is as near that

or the public schools of the State as the necessary modifications will permit. The texts and reference books for this department are in the New York Point, the elementary characters of which are as follows:

NEW YORK POINT ALPHABET.

COURSE OF STUDY.

FIRST YEAR.

Reading.—New York Point.—Alphabet by groups of letters similar in form.

Groups of simple words similar in form and sound selected from the First Reader. Primer and First Reader complete with supplemental work.

Spelling.—All words in the First Reader spelled orally. Special attention given to syllabication.

Writing.—Small letters. Sentence work commenced.

Numbers.—Numbers 1 to 10. Each number as a whole. Relations in the number. Numbers taken away. Fractional parts. All with objects real or imaginary. Drill in rapid combinations.

Language.—Correction of errors in the pupil's language. All answers to be given in complete statements. Exercises on "a" and "an," "is" and "are," "was" and "were."

Geography.—"Seven Little Sisters."

Form.—Plane and solid forms.

Memorizing.—Simple selections from books and papers.

General Lessons.—Lessons on familiar animals, on parts of the human body, and on the care of health.

SECOND YEAR.

Reading.—Point Second and Third Readers, Appleton's First, completed with supplemental work.

Spelling.—Spell all new words found in the Readers—both oral and written spelling. Attention given to syllabication.

Writing.—Point writing. Small letters and capitals. Sentence work.

Numbers.—Numbers 10 to 50, same as in first year. Simple problems to illustrate each relation. Have pupils give simple fractional parts of numbers. Teach Roman numerals. Develop orders to ten thousands. Drill on rapid combination.

Language.—Continued as in first year. Simple lessons on forms of verbs, nouns and pronouns. Forms of sentences. Exercises in changing from one form to another. Simple lessons in letter writing.

Geography.—"Each and All."

Form.—Modeling of solid forms, and of objects related in form. Designs with plane forms.

Memorizing.—Simple selections from books and papers.

General Lessons.—Lessons on common articles of food. Lessons on animals continued.

THIRD YEAR.

Reading.—Point Fourth and Fifth Readers, Appleton's Second, completed with supplemental work.

Spelling.—Oral and written spelling—all new words found in the readers. Attention given to syllabication. General definitions of words as found in the Readers.

Numbers.—Review of previous year's work by miscellaneous rapid combination and subtraction work. Original problems. White's Elementary Arithmetic, Part I.

Language.—Sentence work. Sentences using common verbs in both singular and plural numbers. Common punctuation marks and abbreviations.

Writing.—Copy memory gems and selections read by the teacher in addition to the written work of other recitations. Letter writing.

Geography.—"World and Its People, No. 3."

Memorizing.—Suitable selections from books, papers and magazines.

General Lessons.—Lessons on the human body and on plants and animals.

FOURTH YEAR.

Reading.—Point Sixth Reader, Appleton's Third, completed with supplemental work.

Spelling.—Same as in third year.

Numbers.—White's Elementary Arithmetic, Part II.

Language.—Sentence work continued. Subject and predicate. Plurals and possessives. Principal parts of verbs in general use. Simple compositions on common subjects and about familiar objects. Letter writing.

Writing.—Same as in third year.

Geography.—“Brooks and Brook Basins.”

Memorizing.—Same as in the third year.

General Lessons.—The work of the third year elaborated.

FIFTH YEAR.

Reading.—Point Seventh Reader, Appleton's Fourth, with supplemental work.

Spelling.—Oral and written spelling—all new words in the Reader. Definitions.

Numbers.—White's Elementary Arithmetic, Part III, to Denominate Numbers.

Language.—Reed & Kellogg's Graded Lessons in English to lesson 71.

Writing.—Copy work indicated by the teacher in addition to spelling and language work.

Geography.—Elementary Geography—Indiana Educational Series—to South America. United States studied with dissected map.

History.—“Stories of Our Country.”

SIXTH YEAR.

Reading.—Point Eighth Reader. Appleton's Fifth, with supplemental work.

Spelling.—Same as in the fifth year.

Numbers.—White's Elementary Arithmetic completed.

Language.—Reed & Kellogg's Graded Lessons in English from lesson 71 to page 156.

Writing.—Same as in the fifth year.

Geography.—Elementary Geography—Indiana Educational Series—begin with South America and complete to lesson 50. Study continents of South America, Asia and Africa in general, and Europe with dissected map.

History.—“From Colony to Commonwealth.”

SEVENTH YEAR.

Arithmetic.—White's Complete Arithmetic from fractions to interest.

Grammar.—Reed & Kellogg's Higher Lessons in English from lesson 10 to lesson 85. Much attention should be given to composition work.

Geography.—Complete Geography—Indiana Educational Series—study South America and Asia with dissected maps and review the United States.

History.—“Eggleston's History of the United States” read to the class during the year.

Note.—Spelling should be continued throughout the course in connection with other subjects.

EIGHTH YEAR.

Arithmetic.—White's Complete Arithmetic from interest to the appendix.

Grammar.—Reed & Kellogg's Higher Lessons in English from lesson 85 to lesson 139. Composition work continued.

History.—Barnes' History of the United States.

Physiology.—Steele's Physiology.

HIGH SCHOOL COURSE.

Algebra.	Composition and Rhetoric.	Civil Government.	Physical Geography.	Music or Industries.	NINTH YEAR.
Algebra.	Composition and Rhetoric.	Civil Government.	Physical Geography.	Music or Industries.	
Algebra.	American Literature.	General History.	Physics.	Music or Industries.	TENTH YEAR.
Algebra.	American Literature.	General History.	Physics.	Music or Industries.	
Geometry.	English Literature.	General History.	Sociology.	Latin, Music or Industries.	ELEVENTH YEAR.
Geometry.	English Literature.	General History.	Sociology.	Latin, Music or Industries.	
Geometry.	English Literature.	English History.	Psychology.	Latin, Music or Industries.	TWELFTH YEAR.
Geometry.	English Literature.	English History.	Psychology.	Latin, Music or Industries.	

Forty credits are necessary to graduate from the Literary High School Department. A credit is one-half year's work of one period of recitation daily for five days in a week with necessary preparation. At the end of the eighth year the pupil may elect the industrial, literary or music course.

HIGH SCHOOL TEXT-BOOKS.

Ninth Year—

Algebra—Peck.
Composition and Rhetoric—Wady.
Civil Government—Fiske.
Physical Geography—Maury.

Tenth Year—

Algebra—Peck.
Literature—Reed & Kellogg.
Ancient History—Botsford.
Physics—Gage.

Eleventh Year—

Geometry—Wells.
Sociology—Giddings.
General History—Barnes.
Literature—Reed & Kellogg.

Twelfth Year—

Psychology—James.
English History—Montgomery.
Literature—Reed & Kellogg.
Geometry—Wells.

MUSIC DEPARTMENT.

ADELAIDE CARMAN, Principal, Piano and Pipe Organ.

WM. T. SHANNON, Piano and Harmony.

LULU FISHER, Voice.

BERTHA SCHELLSCHMIDT, Violin and Mandolin.

In this department all pupils of the institution are not given work. All may be admitted, but only those retained who demonstrate considerable capacity. It is not the purpose to burden this department with pupils who have little capacity or taste for music. The chorus classes are the ones most general, but even in this it is useless to retain pupils who have no ability in this line of work. Individual lessons are given to those only who have shown considerable promise of success.

Chorus work is required throughout the entire course from pupils qualified for this. At the eighth year, when pupils have shown sufficient ability and progress, they are given voice and organ work.

The following is the course of study planned for the music department:

PIANO.

FIRST YEAR.

Position of body and hands at piano. A knowledge of braille music. Beginning technical exercises (etudes, legato and staccato, phrasing, etc.). First half of Grade 1, National Graded Course. Recital work (1).

SECOND YEAR.

Technical work. Five finger exercises. Preparatory scale work. First half of Grade 1. Little pieces by Lichner, Crosby, Adams and Dennee, and others (2). Recital work (2).

THIRD YEAR.

Technical work. Five finger exercises all keys and forms, contrary motion, single and double notes. All scales Major and Minor. First half of Grade 2. Sonatinas by Clementi and Kullak (1). Pieces by Hiller, Spindler, Lichner, Reinecek, Loeshorn, Geise and others (2). Recital work (2).

FOURTH YEAR.

Technical work. Preparatory arpeggio work. Preparatory chord work. Scale practice for speed.

Complete second grade. Etudes from Heller, Cramer, Duvernoy, Loeshorn and others (2). Pieces by Heller, Jensen, Bohm, Gade, Schumann (3). Sonatinas from Clementi and Mozart (1). Two hymns. Ensemble work. Recital work (2).

FIFTH YEAR.

Technical work. Progressive scale, arpeggio and chord study. Preparatory octave work.

First half of Grade 3. Etudes by Heller, Loeshorn, Czerny, Cramer and others (2). Pieces by Mendelssohn, Gade, Jadassohn, Jensen, Greig, Schumann, Bendel and others (2). Easy preludes by Bach (1). Two hymns. Ensemble work. Recital work (2).

SIXTH YEAR.

Technical work. Advanced study in scale, arpeggio and chord forms. Progressive octave work.

Complete Grade 3. Beginning work on Sonatas (1). Bach Inventions (1). Field Nocturnes (1). Pieces from Hofmann, Kargenoff, Nevin, Moszkowski, Scharwenka, Schumann, Chopin and others (3). Three hymns. Ensemble work. Recital work.

High School Course.

FIRST YEAR.

Careful study of the first half of Leschetizky's method. Bach's Inventions (2). Sonatas by Mozart and Beethoven (1). Etudes from Chopin, Heller, Moscheles and others (2). Pieces from Chopin, Chaminade, Mendelssohn, MacDowell, Schumann, Greig, Brahms and others (3). Chapel work (six hymns). Recital work (2).

SECOND YEAR.

Complete Leschetizky's work. Bach Inventions (2). Beethoven Sonatas (1). Six selected etudes and pieces from standard writers. Chapel work (six hymns). One Concerto or two piano numbers. Recital work (2).

THIRD YEAR.

Careful study of Doerner's technical work. Bach Preludes and Fuges (1). One Sonata or Concerto. One accompaniment to song or violin for recital. Three selected pieces or etudes. Chapel work (six hymns). Recital work (2).

FOURTH YEAR.

Applied Technic (teaching of two pupils under supervision). Four compositions from modern composers. Chapel work (two anthems). Recital work.

One composition learned without aid of teacher in two months for recital.

Graduating recital.

VOICE.**High School Course.****FIRST YEAR.**

Reading of braille. Position of body and mouth. Position of tongue. Breathing method explained. Single tone work. Simple studies in intervals. Diatonic scales. First twenty-five lessons in Concone. Two simple songs. Recital work (1).

SECOND YEAR.

Studies for sustaining the breath. Correct intonation on mingling of tones. Advanced studies in intervals, Major and Minor. Chromatic scale. Phrasing of words. Last twenty-five Concone. Five songs. Recital work (2).

THIRD YEAR.

Positions of vowels and consonants. Scale work for clearness, speed, and smoothness. Exercises in arpeggio and syncopation. Advanced studies from Abt, Sieber and others. Seven songs from American composers. Recital work (2).

FOURTH YEAR.

Combination of position of tones and words in the mouth. Advanced studies in embellishments. Songs from the classics, Schumann, Schubert and others (10). Graduating recital.

VIOLIN.**FIRST YEAR.**

Position of violin and bow. Reading of braille. Elementary finger exercises. Dancla violin method (4). Harvest of flowers, collection of easy pièces (2). Recital work (1).

SECOND YEAR.

Scale work. Exercises for wrist. First book of Wohlfahrt studies. Elementary work in third position. Easy solos by Sitt, Hermann, Dancla, Demuth, Harris, Palaschko, Allen and others (2). Recital work (2).

THIRD YEAR.

Scales in third position. Easy technical studies for bowing. First book of Kayser etudes. Solos from Becker, Hauser, Fischer, Cooper, Papini, Dancla, Raff, Bohm, and others (4). Recital work (2). Chapel work (six hymns).

FOURTH YEAR.

Second and fifth positions. Technical studies in scales and thirds. Kayser etudes, second book, first half. Beginning ensemble work. Solos from Thome, Schumann, Accolay, Raff and others (4). Recital work (2). Chapel work (six hymns). One sonata.

FIFTH YEAR.

Fourth and sixth positions. Technical studies in positions and octaves. One concertino. Second half of Kayser's etudes Op. 20. Solos by Seitz, Bohm, Schumann, Goddard, Borowski, Raff, Seybold, and others (5). Ensemble work. Chapel work (six hymns). Recital work (2).

SIXTH YEAR.

All positions required. First book of Marza's etudes. Advanced technical studies for bowing. One easy concerto. Solos by Henri, Ern, Hauser, Sitt, Singelee, Papini, and others (5). Chapel work (six hymns). Recital work (2).

High School Course.

FIRST YEAR.

Schradieck's method of scales. Mazas etudes, Book 2. Study of arpeggios and chords. Solos by Simonetti, Schumann, Wieniawski, Viotti, and others (6). Chapel work (six hymns). Recital work (2).

SECOND YEAR.

Schradieck's technical studies, Book 1. Mazas etudes (2). Kreutzer etudes (1). One sonata from Mozart or Haydn. Solos by Vieuxtemps, DeBeriot, Bazzini, or the old Italian School (2). Chapel work (six hymns). Recital work (2).

THIRD YEAR.

Schradieck's technical studies, Book 2. Kreutzer and Fiorillo etudes (2). One Bach study. One concerto by De Beriot, Viotti, or Rode. One obligato to a song. One solo by any of the above composers. Chapel work (six hymns). Recital (2).

FOURTH YEAR.

Schradieck's technical studies. Kreutzer and Fiorillo and Rode's etudes (2). One Beethoven or Corelli sonata. One solo by a modern composer. Solos by Hubay, Vieuxtemps, Saint-Saens, Leonard DeBeriot, Spohr, or some modern composer (1). One composition learned alone in two months. Must teach two pupils. Graduating recital.

ORGAN.**High School Course.****FIRST YEAR.**

Pupil must have at least five years of piano and read braille music. Position at organ. Arrangement of organ and mechanical appliances. Name, character and position of stops. Stainer organ method (six studies). Technical work for pedals. Two hymns. Recital work (1).

SECOND YEAR.

Complete Stainer method. Pedal studies by Dudley Buck (3). Four hymns. One anthem. Two pieces. Chapel work. Ensemble work. Recital work (2).

THIRD YEAR.

Dudley Buck pedal studies (complete). Bach easy preludes and fugues (2). Six hymns. Three anthems. Four selected pieces. Chapel work. Recital work (2).

FOURTH YEAR.

Bach prelude and fugue (1). Four selected pieces. One concerto or sonata. Six hymns. Four anthems. One composition learned alone in two months. Graduating recital.

CHORUS WORK.

SENIOR CHOIR—Two standard hymns. Four anthems. Four mixed choruses. One chorus from an opera or an oratorio or a complete cantata. Special songs for Thanksgiving, Christmas and Easter.

JUNIOR CHOIR—Ten hymns. Season songs. Songs for two and three part study. Special songs for Thanksgiving, Christmas and Easter. Appear twice in recital work.

MANDOLIN COURSE**FIRST YEAR.**

Reading braille. Finger exercises. Scale work. Easy solos (1). Recital (1).

SECOND YEAR.

First Book Henlein Method. Scale work. Technical studies. Solos (2). Recital (1).

THIRD YEAR.

First half of Second Henlein Method. Technical studies in third. Third and fifth positions. Solos by Lange, Tobani, Mascagni, etc. (2). Recitals (2).

FOURTH YEAR.

Second half of Second Henlein Method. Technical studies in third. Third and fifth positions. Solos by Lewis, Tobani, Singelee, Gillet (2). Concerted work (one composition). Recitals (2).

FIFTH YEAR.

Technical studies in third and sixth. All major and minor scales. All positions. Concerted work (one composition). Solos by Lewis, Singelee, or any modern composer (3). Recitals (2).

To graduate from the Music Department a student must meet the requirements of the High School Course, having carried the necessary preparatory work through the grades of this school or its equivalent in other schools.

Organ study must be preceded by at least five years' piano work. Chorus training is required throughout the entire school course unless the student is unable to sing.

Forty credits are necessary to graduate. A credit equals one-half year's work of one recitation period daily with necessary preparation.

GENERAL READING.

Each school day for a period of forty-five minutes the teachers read from selected works to each grade.

The list of books is here given for the High School and Grades 7 and 8:

Eugene Aram Lytton	Last of the Barons.....Lytton	Harold Lytton
The Sisters..... Ebers	An Egyptian Princess..Ebers	Cleopatra..... Ebers
Rob Roy.....Scott	Waverly. Scott	Marmion Scott
A Princess of Thule...Black	In Far Lochaber.....Black	A Daughter of Heth...Black
Malcolm.....MacDonald	The Marquis of Lossie—MacDonald.	Alec Forbes MacDonald
Treasure Island ..Stevenson	Kidnapped Stevenson	David Balfour....Stevenson
Hunchback of Notre Dame—Hugo.	Toilers of the Sea..... Hugo	Les Miserables..... Hugo
Romola..... Eliot	Felix Holt.....Eliot	Mill on the Floss..... Eliot
Tale of Two Cities..Dickens	Cricket on the Hearth—Dickens.	Nicholas Nickleby..Dickens
Red Rover.....Cooper	Pilot Cooper	Pioneer..... Cooper
Hypatia Kingsley	Prince of India. Wallace	Corinne.....DeStael
Cymbeline.....Shakespeare	Timon of Athens—Shakespeare.	Coriolanus Shakespeare

LIBRARIES.

The embossed library has been carefully arranged and catalogued under the supervision of Mr. Evens. The rooms have been repainted and additional stacks provided so that the books are carefully protected and the value of the library to the school much enhanced.

The library of printed books has also been carefully catalogued and arranged. Additional room has been provided and the number of books largely increased.

GRADUATES' FUND.

In many cases pupils who have graduated from this Institution have not means to commence business. The cost of machinery and supplies for the shop is not great, but in many instances wholly beyond the reach of the graduates. Several attempts have been made to establish a fund to help worthy graduates. The following exhibit gives sources of this fund and the number of pupils assisted, as shown by the reports of the superintendents:

From unknown, Jan. 27, 1862.....	\$100 00
From Silar Bond, May 11, 1863.....	27 16
From Mrs. Fitzpatrick, July 24, 1865.....	573 77
From unknown	99 25
Total	\$800 18
Earnings to Nov. 1, 1906.....	1,181 79
Total to above date	\$1,981 97
Paid for machines for sixty-one graduates to Nov. 1, 1906.....	1,164 96
Balance	\$817 01

EARNINGS.

The earnings of the Institution are necessarily small, about the only source being the Industrial Department. As the purpose in this is to teach some form of industrial work to each pupil for relaxation, for physical development and for future use, and these pupils, as soon as they become proficient, generally engage in work for themselves, the finished output of the department is small. The total receipts for the past fiscal year were \$299.87.

CLOSING EXERCISES.

The usual closing exercises were observed. The final concert was largely attended and enjoyed by all. The gymnasium exhibition was unique and successful. The graduating exercises were given in the chapel on June 2d, 4th and 6th. Governor J. Frank Hanly was present on the 6th and presented the diplomas to a class of ten. His address was eloquent and a gracious favor to the graduates, who fully

appreciated his kind words. The following is the commencement program in full:

GRADUATING RECITALS.

Saturday Evening, June 2, 1906, 8 O'clock.

TEACHERS AND EMPLOYEES.

Several resignations have compelled the appointment of new persons. Miss Adam, vocal music teacher, and Miss Hamilton, literary teacher of Room 1, were married during vacation. Both were excellently prepared for their work. These places were filled by the appointment of Miss Fisher and Miss Reynolds, who were well recommended and have demonstrated that their selection was fortunate. Mr. Heltzel, the chief engineer, resigned after a period of satisfactory service of over twenty years in this Institution. Mr. Sharp was selected to take this place and is doing his work

well, having had five years' previous employment as assistant in this line of work. Several employes voluntarily withdrew for more lucrative employment. It has been necessary to raise wages in order to meet the increase elsewhere. There has been difficulty in recent years in keeping the minor positions filled with competent persons.

BUILDINGS.

There are seven buildings, generally in good condition. The school building is large and imposing, over fifty years old, but of substantial structure, and in most parts in good repair. The towers show signs of age and the roof on the front part will soon need renewal.

The heating apparatus is out of balance and inadequate. The shop building is nearly sixty years old and in bad condition. The bake shop, the power house, the stable and the greenhouses are in good condition and sufficient in size and equipment for their several purposes, except that the power house needs an additional boiler for high pressure.

The girls' dormitory is a beautiful, substantial structure, well ventilated and lighted and well heated.

The laundry should have an addition to the north and the heavy machinery removed from the present location.

NEEDS.

We should have for the next two fiscal years the same appropriations as at present. Perhaps a slight advance should be made in the maintenance appropriation, owing to higher wages and increased cost of foods. The other regular appropriations are sufficient. Special appropriations should be made for a high-pressure boiler and for an engine to run the machinery of the laundry. There should be an addition to the laundry in order to remove the heavy machinery from the wood floors and give additional room for the dry work. There should be an appropriation for a boys' dormitory. In order to secure the best work, to give proper supervision, and to properly protect the boys, the need of the dormitory is imperative.

Respectfully,

GEORGE S. WILSON.

FINANCIAL.

Receipts and disbursements for fiscal year ending October 31, 1906:

INFORMATION.

1. The purpose of this Institution is purely educational. The aim is to give a practical education to the young blind of both sexes residing in the State. All the common school branches are taught. An extensive course in music is available to all who have talent in this direction. A thorough course is given in several industrial trades, such as broom making, cane seating chairs and piano tuning. The girls learn sewing by hand and machine, knitting, crocheting, bead and fancy work. The purpose is to make the pupils useful, contented, self-supporting citizens. A gymnasium is equipped and a special teacher drills the pupils in systematic physical exercises. Pupils when not in recitation are in charge of a governess. Neatly furnished hospitals are provided for the sick.

2. The school year commences on the fourth Wednesday of September and closes the first Wednesday after the first Monday of June. There is no vacation during the session.

3. Applicants who are under eight or over twenty-one years of age are not admitted.

4. No person of imbecile or unsound mind, or of confirmed immoral character will be knowingly received into the Institution, and in case any pupils shall, after a fair trial, prove incompetent for useful instruction or disobedient to the regulations of the Institution, such pupils will be thereupon discharged.

5. The Institution is maintained by the State, and tuition, board and washing are furnished free of cost to all pupils residing in Indiana. The parents or friends of pupils must supply them with comfortable clothing, suitable for summer and winter wear, in such quantity as will admit of necessary changes. Each article of clothing should be distinctly marked with the owner's name, and must be sent in good condition. The traveling expenses of pupils must be defrayed by parents or friends.

6. It is positively required that every pupil shall be removed from the Institution during the annual vacation of the school, as well as at any other time when such removal may be deemed necessary by the proper officers thereof; and in case of failure of friends of any pupil to comply with this requisition, provision is made by the law for sending such pupil to the trustee of the township in which he resides, to be by him provided for at the expense of the county.

7. Parties desiring the admission of a pupil are required to fill up the required form of application and forward the same to the Superintendent of the Institution, giving truthful answers to the interrogatories therein contained, and procuring the signature of a justice of the peace to the certificate thereunto attached; and the pupil must in no case be sent until such application shall have been received and favorably responded to by the Superintendent.

8. The Superintendent will cheerfully give information in regard to the Institution, and will thankfully receive any information concerning those who should be receiving its benefits.

9. Persons bringing pupils to the Institution or visiting them can not be accommodated with board and lodging.

10. That the work of the Institution may be done to the highest good of all it is necessary that every pupil shall be present at the opening of the term. Faithful work and prompt and regular attendance are essential to advancement and promotion. No pupil who is tardy at the beginning of the term, is irregular in attendance, or drops out before the close of the term, can hope to do acceptable work and receive promotion. Unless there is an excellent reason for doing otherwise, every pupil should be present on the first day and remain throughout the term.

11. Each pupil before entering the Institution should be supplied with the following clothing of good quality:

Boys—Two hats, two suits of clothes, two extra pairs of pants, four pairs of socks or six pairs of stockings, four shirts, two suits of underwear, two pairs of shoes, six handkerchiefs, two pairs of suspenders, a toothbrush, a clothesbrush, and a comb and hairbrush. Small boys need no suspenders, but should be supplied with an extra suit of underwear.

Girls—Two woolen and two cotton dresses, four aprons, three night dresses, two suits of summer and three of winter underwear, two dark and two light skirts, six pairs of stockings, six handkerchiefs, a wrap, a hat, rubbers, two pairs of shoes, a toothbrush, a clothesbrush, a comb and hairbrush.

This amount of clothing will be necessary within the year, that the children may be kept clean and comfortable. When parents are not able to furnish the required clothing they should not hesitate to call upon the Township Trustee, who will cheerfully provide for the needs of those who are worthy. All clothing should be marked with indelible ink.

12. It will be necessary for parents, guardians, etc., to provide for all incidental expenses of pupils. It will likewise be necessary for all persons sending children to the Institution to furnish them transportation to their homes at the close of the term.

TERM CALENDAR FOR 1906-1907.

Annual session began September 26.

Annual session ends June 12.

First term ends November 30.

Second term ends January 31.

Third term ends June 8.

Grade days—December 1, February 1.

Mid-year examinations (written) begin January 21.

Final examinations (written) begin May 15.

Commencement exercises—June 12.

Departure for home—June 13.

HOLIDAYS FOR PUPILS.

November 29—Thanksgiving Day, Thursday.

December 24-25—Christmas, Monday, Tuesday.

January 1—New Year, Tuesday.

February 22—Washington's Birthday, Friday.

May 30—Decoration Day, Thursday.

June 11—Lawn Social; Closing Day, Tuesday.

June 12—Commencement exercises, Wednesday.

June 13—Departure for home, Thursday.

LECTURE COURSE, 1906-1907.

October 6—

Albert Berg, "Noted Events of the Summer."

October 20—

William H. DeMotte, "The Results of Education."

November 3—

N. Field Morrow, "The Discovery of the North Pole."

December 15—

August Jutt, "Our Judicial System."

January 5—

Orson Archibald, "A Trip Through Mexico."

February 23—

Henry Bierhaus, "Tariff Laws."

March 16—

Sidney J. Vail, "Fifty Years Hence."

March 30—

Utten E. Read, "The Banking System."

April 27—

Edward J. Hecker, "The Conquest of Africa."

May 25—

Albert Berg, "Noted Events of the Year."

LITERARY SOCIETIES, ETC.

The literary societies will meet during the year as follows:

Girls' Literary Society—November 17, January 26.

Johnson Literary Society (Boys')—December 1, March 9.

Joint Celebrations—January 12, April 13.

Practice Nights—Alternate Fridays.

The Merry Club—May 11.

PUPILS' PARTIES, ETC.

November 29—

Thanksgiving social.

December 25—

Christmas Celebration and party.

January 1—

New Year social.

February 9—

Valentine masquerade party.

June 4—

Lawn social and supper.

HOLIDAYS FOR PUPILS.

November 29—

Thanksgiving Day.

December 24-25—

Christmas.

January 1—

New Year.

February 22—

Washington's birthday.

May 30—

Decoration Day.

On Thanksgiving, Christmas, New Year, Washington's Birthday and Decoration Day holidays, school and work for pupils will be suspended the entire day, and the usual exercises incident to the times will be observed.

REPORT OF BOARD OF TRUSTEES.

To the Honorable J. FRANK HANLY, Governor of Indiana:

Sir—The Board of Trustees of the Indiana Institution for the Education of the Deaf respectfully submit the following report for the fiscal year ending October 31, 1906:

The progress of the pupils, as well as the character of the work in the classroom, has been very satisfactory. The attendance has been about the same as that of the previous year. The present accommodations being so limited, it was impossible to take care of all who desired to attend. Notwithstanding the unsatisfactory condition of the buildings, the health of the children has been fairly good. The credit for this is due largely to the very efficient care and watchfulness of the Superintendent and his staff, and to the careful attention of the physician. It is confidently believed that when the school is in its new quarters, where the pupils will have an abundance of fresh air, the number of cases requiring a physician's care will be reduced at least one-half.

With reference to the physical condition of the Institution, we can but repeat what we stated in our former report—the policy of the Board has been to expend for repairs and improvements the least possible amount of money, and only such outlays have been made as were absolutely necessary to the comfort of the pupils.

This, however, exhausts the present annual appropriation (\$1,000), which is but one-fourth the usual amount heretofore given for current repairs. This reduced appropriation has prevailed now for three years. For the safety of the children there will be required a greater expenditure in this direction the coming year than was made in the past year. The increased amount needed is set forth in the Superintendent's report.

Referring to the work of relocating the Institution, the

Board, which is a part of the Commission of which you are President, desires to report that substantial progress has been made. The plans and specifications for the twenty-two buildings have been completed and accepted, the proper advertising done and the contracts awarded as follows:

Heinzmann Brothers, general construction	\$710,200 00
Woolen & Callon, heating	41,022 50
Woolen & Callon, mechanical equipment	71,770 00
Sanborn & Marsh, electrical wiring	18,565 00
J. S. Farrell & Co., plumbing.....	74,657 00

Total contracts	\$916,214 50
-----------------------	--------------

The contracts for the schoolhouse, dining-hall, kitchen—bakery and power-house were absolute—the cost of these coming within the appropriation already made. The contracts for the remaining buildings are conditional, depending upon the action of the General Assembly now in session.

The buildings, as planned, are not for the present only, but for a school of at least five hundred pupils, with crowded capacity for 720. When the plant is completed there will be no necessity for other expenditures of any kind. What would seem economy at the beginning might prove very expensive in a long term of years.

While the members of the Board have given much time and thought to the erection of the new buildings, yet they have not for a moment lost sight of their responsibility to the children entrusted to their care, to the end that they may have the full benefit of all the advantages offered by the State.

The Board desires to call your attention to a fact with which you are already thoroughly familiar, that this Institution is not an asylum in any sense of the term, nor a benevolent or charitable institution, but, on the contrary, one of the State's educational institutions, conducted wholly as such. Those attending being unfortunate should have not only all advantages of pupils attending public schools, but, on account of their infirmity, should have even better advantages. The fact that free tuition and board is given

to all who attend and, in some cases, clothing paid for by their home counties is furnished, does not constitute charity on the part of the State. These deaf children, even as their more fortunate hearing-speaking brothers and sisters, are entitled to free education as an American birthright. It is more economical and productive of better results for the State to gather them into a central school than to supply hundreds of teachers in the many public schools over the State. Though separation is a painful sacrifice to parents, they are sent, often unwillingly, into the hands of strangers for the good of the child and the State's benefit, and their enforced absence is in nearly all cases a pecuniary loss to parents who miss their labors on farm and in household.

We would also respectfully call your attention to the facilities offered for preparing teachers for the different departments. So satisfactory has this been that there is always a demand for instructors who have had the advantages of the training school.

That the pupils may have the very best advantages it has been the policy of the Trustees of the Institution to employ none but thoroughly trained instructors. The result, as indicated by the progress of the pupils, shows the wisdom of such a policy.

The same care exercised in the employment of teachers is carried out in the employment of other helpers, to the end that the children may not be subjected to any pernicious influences. In order to preserve this high standard already established, it has been found necessary, on account of changed conditions—high prices of living, etc.—to advance quite materially the salaries of many of the teachers and employes. While this increase has been limited in every way possible, yet the Board may find it necessary to make still further increase of salaries of officers, teachers and employes.

To meet these and other emergencies referred to by the Superintendent, the present appropriations will be found inadequate. The actual needs for these purposes are fully set forth in the Superintendent's report.

We are pleased to report that the finances of the Institution are in a very satisfactory condition. The Board has exercised every care possible in order that the funds entrusted to them should be wisely expended.

The regular and specific appropriations (excess maintenance) amounted in the aggregate to \$75,519.45, the total expenditures to \$70,577.06, leaving unexpended \$4,942.39. This unexpended balance, together with \$948.38 expended out of funds to be repaid to the State by counties for clothing furnished indigent pupils, and \$759.36 cash earnings received, amounts in total to \$6,650.13. This was returned to the State's general fund and must stand to the credit of the Institution against the total appropriation of \$75,519.45, thus leaving a net cost to the State of \$68,869.32, or \$210.31 per capita.

The sale of the present site of the Institution, together with the interest on the same, amounted on October 31, 1906, to \$204,196.94. The appropriation made for the new buildings was \$315,000.00. Deducting from this amount the amount realized from the sale of the present site, together with the interest accrued to October 31, 1906, \$204,196.94, the amount standing leaves the net appropriation of the State \$110,803.06.

For detailed information concerning receipts and disbursements for maintenance, industries and repairs; concerning clothing expense, farm and garden products raised, and cash earnings received; and for various other matters, fiscal and scholastic, your attention is called to statements and exhibits in the Superintendent's report, hereto attached and made part of this report.

Respectfully submitted,

HENRY B. BROWN.

WILLIAM W. ROSS.

WILLIAM P. HERRON.

SUPERINTENDENT'S REPORT.

To the Board of Trustees:

Gentlemen—I submit for your consideration the following statement concerning financial transactions and scholastic record of the Institution for the fiscal year ending October 31, 1906, it being my eighteenth annual report as Superintendent and the sixty-third annual report of the School.

The roster of officers, teachers, and attendants is somewhat different from that of one year ago. Mrs. Janette V. Archer, a most excellent and faithful teacher, died just at the close of the school-year in June. Mr. Tunis V. Archer, supervising teacher of oral work, declined reappointment to accept the position of principal in the school at Morganton, North Carolina. Miss Frances L. Glenn succeeds to the position held by Mr. Archer; Miss Amelia DeMotte has been assigned to assist her in normal class work; and Misses Nell E. Arbaugh and Nancy B. Read, both experienced oral teachers, have been employed to fill the two vacancies. Miss Olive Hawkins, formerly of the training-class of this School and later with experience elsewhere, has been temporarily engaged to assist with the kindergarten work. Mr. Clarence A. Carll has been appointed to a newly-created position, to be known as that of auditor, and in the rearrangement of duties incident thereto, Mr. William E. Todd is now serving as storekeeper, and Miss Nellie M. Voorhees as secretary to the Superintendent. Additional supervisors have been employed, two on the boys' side, Mr. Lonnie Whiteside and Miss Rika Vahle, and one on the girls' side, Miss Gertrude A. Schad. During the year Miss A. Belle Handy was employed as usher; Mr. Frank Baker, as watchman; Miss Katherine J. Ogilvie, as nightwoman; and Mr. L. Scott Clark, as electrician.

Of the teachers in training during the past school year,

Miss Leora Carver completed the regular training course of two years in June and is now employed as teacher in the Iowa State School. Misses Maude Carter and Floss A. Behymer have returned for their second year's work, and I have accepted as a new member of the class Miss Louise O. Sims of Danville, Ky.

THE NORMAL CLASS.

The Normal Class, or class for teachers in training, had its inception in 1890, when first I appointed a young woman as teacher of physical exercise, who was to serve also as substitute teacher, under guidance, as opportunity presented, through which means she was expected to acquire sufficient insight into the work and experience to become a regular teacher. This arrangement continued until 1894, when the Kindergarten department was established. At that time one assistant, a teacher in training, was appointed, the former position of teacher of physical exercise being done away with. In 1896 three teachers in training were received, and the number in attendance at any one time since that date has been not less than three nor more than five. Prior to 1899 only one year's training was given to or required of each member of the class; but in that year a two-years' course was established, which has continued to date.

Since 1890 thirty young women have been enrolled as members of this Normal Class. Of the entire number fifteen are now teaching in various State Schools for the Deaf (six in this Institution), six have married, one has died, five are not engaged in schools for the deaf so far as known, and three are in the class at the present time.

The full term of this course for teachers in training is two years and no one is received for a less period; and but two (or three, according to circumstances) will be accepted each year. Candidates for admission must present testimonials of high character and standing, evidences of satisfactory preliminary scholastic attainment, certificates of good health and necessary strength, and be possessed of

self-confidence, gentle firmness, patience, love for children, and a desire to make teaching a life profession—otherwise they would better not apply. A student's mind and habit, and an enthusiastic desire to accomplish things and succeed, are demanded. Admission to the privileges of this course means undivided attention, close application, and hard work on the part of the teachers in training for two years; and personal and social diversion will not be permitted to interfere with school or other duties, nor with periods of study.

When entering upon the discharge of their duties, the members of the class are given full and regular charge of assigned classes under supervision, in Kindergarten or Primary departments, or in both. They are also assigned certain monitorial duties with pupils, leading them to more intimate knowledge of the deaf child outside the school room. Supervision in the work is given by the chief kindergarten, the supervising principal of oral work, the supervising principal of primary grades, the normal instructors, and by the Superintendent. In the Normal Class, upon stated days, there is given regular instruction under skilled teachers in Principles of Speech; in Physiology and Anatomy, concerning the respiratory organs, vocal organs, and the ear; and in Voice and Visible Speech. They are also required, as regular class work, to take up the study of the History of the Education of the Deaf; of Elements of Pedagogy and Psychology; and of Methods of Language teaching. Oral and written examinations are required during the year. A small but complete library of reference books for this normal work is provided for the use of the members of the class, who, however, must buy their own text-books.

The services of these teachers in training are required by the Institution at all times during the two scholastic years, without compensation. They are required to live in the Institution, and room, board and laundry work is furnished them without cost. They are subject to all rules and regulations governing officers, teachers and employes, and their whole time must be devoted to the work. Posi-

tions as teachers are not promised them here nor guaranteed them elsewhere, and at the completion of their training course they must take their chances in securing suitable positions in other schools for the deaf, according to their capabilities.

ADMISSIONS, ATTENDANCE, ETC.

The following tabulations will show admissions, discharges, attendance and nonattendance for the fiscal year, which includes parts of two school years:

	<i>Boys.</i>	<i>Girls.</i>	<i>Total.</i>
Actual attendance, November 1, 1905.....	175	150	325
Late in returning	3	...	3
New pupils received during the year.....	22	23	45
Readmitted after absence of year, or more.....	3	5	8
Total enrollment during year.....	203	178	381
Discharged during year	15	9	24
Leaving enrolled for new year.....	188	169	357
Actual attendance October 31, 1906.....	172	153	325
Showing absentees from last school year.....	16	16	32

CAUSES OF DISCHARGE.

Continued absence (boy).....	1
Death (boy)	1
Nonprogression and expiration of time (boys, 2; girl, 1).....	3
Removal from State (boys, 4; girls, 2).....	6
Graduation (boys, 7; girls, 6).....	13

CAUSES OF NONATTENDANCE.

(Assigned by parents.)

Poor physical condition (boy).....	1
Removal from State (boy).....	1
Sickness in family (boys)	2
Refused to come (girls)	2
Helping at housework (girls)	4
Working (boys)	5
Sickness (2 boys, 3 girls)	5
No cause assigned (5 boys, 7 girls)	12

RESIDENCE OF PUPILS.

Your attention is called to a tabulated statement, arranged by counties, in a subsequent part of this report, showing the number of pupils received, the number discharged and the number remaining entitled to the benefits of the school. The number entitled to its benefits is larger than the number shown at the end of any one year, for this statement refers only to those who have been in attendance at some time during the fiscal year, those of the preceding years being dropped from consideration. An inspection of the statement will show that pupils have been received from eighty-two of the ninety-two counties, those not represented being Benton, Brown, Crawford, Decatur, Jennings, Ohio, Scott, Union, Vermillion and Warren.

ATTENDANCE AND CLASSIFICATION.

The total enrollment of pupils during the fiscal year, including as it does parts of two school years divided by a summer vacation, was 381 (203 boys, 178 girls) or six less than during the preceding year. Of this entire number twenty-four were discharged and thirty-two have failed to return after their summer vacation, although entitled to the privileges of the School. The daily average attendance during the school terms of the fiscal year was 314.02 (boys 169.22, girls 144.80), as against 323.41 (boys 175.73, girls 147.68) for the preceding year, a decrease of 9.39. The attendance on October 1, 1906, was 325*, exactly the same as on the corresponding day one year ago. The pupils are assigned to twenty-nine classes, their average number to class, and average age and attendance being as follows:

	<i>Classes.</i>	<i>Pupils.</i>	<i>Average to Class.</i>	<i>Average Age.</i>	<i>Average Years in School.</i>
Primary, manual (sign)	9	95	10.5	13.9	5.46
Primary, oral (speech)	8	98	12.2	12.2	3.94
Intermediate, manual	2	23	11.5	16.4	9.13
Intermediate, oral	1	13	13.0	14.9	6.92
Academic, manual	3	23	7.7	18.4	10.52
Academic, oral	2	19	9.5	17.2	7.79
Kindergarten, oral	4	56	14.0	8.5	1.52
Manual classes	14	141	10.0	15.0	6.88
Oral classes	11	130	11.9	13.2	4.80
Entire school	29	327	11.2	13.2	5.14

* Attendance November 13, 1907.

Small household work (sweeping, dusting, making own beds, etc.), the 97 above and	58
Of the whole number, scientific cooking, none; art work, etc., 34; typewriting, 4.	

ACADEMIC AND INDUSTRIAL WORK.

Concerning the academic and industrial work of the Institution, it is believed that steady advancement is being made, although our crowded condition and environment at the present time are largely deterrent factors which must be taken into consideration when reaching any conclusion as to satisfactory progress. There is no question in my mind but that greatly increased progress will be made in our new Institution now building when we are finally settled there under much improved conditions over what now prevail with us.

As to the division of the School into classes in both departments, and concerning the average number of pupils to each class, their average age and their average years in school, your attention is called to tabulations set out in a preceding part of this report, under the heading of "Attendance and Classification."

The following tables, showing the examination results for 1906, will indicate the standing of the pupils in the various subjects enumerated. In none of the tables are the

four Kindergarten classes included. The January examination covers the work of the first half of the year; the May examination covers the whole year and is the more exacting one. The test questions submitted to the pupils were the same for both the Manual and Oral classes in the Primary grades, but varied somewhat in the Intermediate and Academic grades, being prepared by different teachers, although covering common ground and practically the same. The average results of these two examinations are expressed in percentages of 100. In all cases, the examination papers have been thoroughly examined and very close marking done, so closely, indeed, that the averages here given are really somewhat lower than they should be.

The yearly examination averages, from 1903 to 1906, show a very decided and pleasing increase from year to year. In considering the figures in either one of the three tables, it should be borne in mind that among the Manual classes are one or two composed of non-progressive pupils, who seem to be unable to make much further advancement, and with such classes, as a matter of course, examination results are always low, thus tending to pull down the higher and more satisfactory averages of the other classes in the department. If it were not for these classes a comparison of results in the two departments (manual and oral) would show the standing to be more nearly equal than indicated, notwithstanding the variance in nature and degree of deafness prevailing among the pupils as disclosed in a succeeding table. In the manual classes, out of 139 (congenital 60, adventitious 79) we find 113 (81 per cent.) totally deaf in one or both ears (41 congenital, 72 adventitious); while in the oral classes, out of 123 (congenital 37, adventitious 86) we find but 81 (66 per cent.) likewise affected (24 congenital, 57 adventitious). In the manual classes are only 12 with feeble or considerable hearing in both ears, while in the oral classes there are 39.

EXAMINATION RESULTS 1906—AVERAGES.*

		Language.	Arithmetic.	Geography.	History.	Physiology.	Physics.	Civics.	Average.
January, 1906, Examination—									
Primary Grades,	Manual.....	71	72	75					73

GRADUATIONS.

At the close of the school year in June, the usual commencement exercises were held, seven young men and six young women, who had completed the full course of study, being presented for graduation honors. Their names, residence and subjects of essays or recitations follow:

SENTIMENT OF CLASS—LOYAL IN EVERYTHING.

Maud May Beyer, Seymour	Essay, "Evangeline."
Richard Harry Phillips, Indianapolis	Essay (Oral), "Aerial Navigation."
Perry Keys, New Market	} Concert Recitation, "The Hunter's Song." (Barry Cornwall.)
Herschell P. Miller, Oakland City. . .	
Walter Wesley Mosby, Mosby	
Charles Franklin Rosenbaum, Can- nelton	

Carrie Suit, Aurora.....	Essay, "Rip Van Winkle."
Samuel Gotlieb Ottenbacher, Ashboro..	Essay, "The Education of the Deaf."
Bertha Alice Tuckey, South Bend....	} Concert Recitation, "The Three Best Things." (Henry Van Dyke.)
Stella Louisa Barr, Indianapolis.....	
Florence Mabel Tuckey, South Bend..	
Harry Vinton Jackson, Lafayette.....	Essay (Oral), "A Character Sketch of Cities."
Agnes Miriam Lake, Red Key	Essay, "Woman's Work of Today."

On Sunday morning, June 3, the baccalaureate sermon was given by the Rev. Austin W. Mann, a graduate of this school in 1858. In the afternoon, an address was delivered by the Hon. J. Frank Hanly, Governor of the State. On commencement day, the address was delivered by the Hon. Hugh Th. Miller, Lieutenant-Governor of Indiana, and presentation of diplomas made by the Hon. Henry B. Brown, president of the Board of Trustees.

INFIRMARY MATTERS.

The case-record below shows 408 cases registered in the infirmary during the year, 197 boys and 211 girls. An inspection of the list shows that of the total number recorded 97 had intestinal irritations, 82 coughs, colds and catarrhal affections, 53 tonsilitis, 23 neuralgia and headache, 14 rheumatism, 2 pneumonia, 26 skin eruptions, 1 measles, 1 membranous croup, 17 mumps,* 9 scarlet fever, 11 toothache, 5 malaria, 21 injuries due to accidents, 6 affection of eye and 40 with various afflictions.

On March 31, a case of scarlet fever developed among the girls. This was followed by eight more, and of the nine cases, five were girls and four boys. In addition to the nine pupils referred to, one of the young women employes contracted the disease, making ten cases in all. Complete recovery without complication resulted in all cases.

During the year it became necessary to employ special nurses from time to time to properly care for contagious or serious illness needing constant attention, at a cost of \$216.00 for 107½ days' services, and this amount is charged to Drugs, Medicines and Appliances.

*Between October 29 and December 10, 117 cases of mumps developed among the pupils and two cases among the employes. In a few instances complications appeared, but all have made satisfactory recovery.

One death occurred during the year. On Sunday morning, November 5, Oliver S. Puckett, nine years of age, a pupil in the school from Shelburn, Sullivan county, ran away from the Institution and could not be located. Later in the day, about two o'clock in the afternoon, while walking upon the track of the Vandalia railroad, four miles west of Indianapolis, he was struck and instantly killed by the cars. On the following day, the body in charge of one of the teachers, was sent to the home of his parents for interment.

DEGREES OF DEAFNESS—612 PUPILS.

In May, 1903, an examination was made in this school to ascertain the degrees of deafness in 300 pupils. Again, such an examination was made in May, 1906, with 312 pupils. Neither of these were searching, scientific examinations such as a specialist would make by means of specially devised instruments of delicate and exact nature for the purpose of determining pitch and intensity of sounds and for ascertaining the degree of bone and air conduction, etc., but were made by the teachers in the school-rooms by means of voice, bells, etc., so as to determine the degree of hearing each pupil had in either ear that could be put to

use in the daily work, or that might possibly be of some use to the pupil in ordinary conversation.

The results of these examinations in comparison follow. It is to be understood, of course, that about 200 pupils, who were included in the 1903 examination, are also included in the 1906 examination, but there has been sufficient change in the roster of the school to afford a valuable comparison of the relative degrees of deafness, etc.

These two examinations as made, the one in 1903, the other in 1906, with a greatly changed list of pupils, in the light of facts disclosed in the above tables and with knowledge of physical conditions of the pupils would seem to warrant the following conclusions, presuming ordinary conditions, i. e., absence of epidemics of wide-spread nature:

1. That of any given number of pupils drawn together into the school, 37 per cent. will show congenital deafness and 63 per cent. adventitious deafness, if based upon statements of parents.

2. That 79 per cent. will show total deafness in one or both ears; 33 per cent. feeble hearing in one or both ears, and 12 per cent. considerable hearing in one or both ears (some, of course, being twice counted).

3. That there will be 57 per cent. with total deafness in both ears (cong. 23, adv. 34); 10 per cent. with feeble hearing in both ears (cong. 3, adv. 7); 8 per cent. with considerable hearing in both ears (cong. 3, adv. 5); 21 per cent. with total deafness in one ear, feeble hearing in the other (cong. 7, adv. 14); 2 per cent. with total deafness in one ear, considerable hearing in the other (cong. 1, adv. 1); 2 per cent. with feeble hearing in one ear, considerable hearing in the other (cong. 1, adv. 1).

4. But, that these percentages are gradually decreasing, and will continue to do so to a certain extent, for those with total deafness, and increasing for those with feeble and considerable hearing because of the fact that a number of hard-of-hearing pupils of the public schools who are not making satisfactory progress therein, are now applying for admission into the school for the deaf, the nature of which is becoming better known, and wherein speech is now taught and used and the methods in vogue no longer of secret and mystifying nature but approximating the methods used with the ordinary normal youth.

5. That the percentage of defective sight is slightly less for those

congenitally deaf (24.8) than for those adventitiously deaf (26.1), the average agreeing with reports made by examiners of public school children for defective vision in various places—Providence, R. I., for one, where 25 per cent. of the children were reported as having defective vision; that of the congenitally deaf with defective sight 69 per cent. are totally deaf, while of the adventitiously deaf, 51 per cent. are totally deaf, indicating that total deafness, whether of congenital or adventitious nature, is more likely to be accompanied by defective vision than is partial hearing.

6. That adenoid growth, enlarged tonsils, and defective teeth have exerted deleterious influence in producing and intensifying defective hearing and vision, and causing ill-health, and that a goodly proportion of adventitious cases of deafness and of defective vision is due to the lack of proper and timely surgical interference and treatment.

CLASSIFICATION OF DEAFNESS.

The inquiry is often made as to the number of persons born deaf (congenital deafness) and the number who have lost their hearing through disease and accident (adventitious deafness). In schools for the deaf, the only information concerning the matter is given by the parents, and in many cases they are more or less uncertain for various reasons. As returned by them to this school, about 33 per cent. are congenitally deaf and 67 per cent. adventitiously deaf, the latter including a large proportion (15 per cent.) losing hearing under one year of age, and a still larger proportion (35 per cent.) under two years.

The line of separation between the two classes is more or less a shadowy one, the latter class being largely qualified by conditions. To such an extent is this true that a third class should be enumerated as congenito-adventitious, to embrace all classes of deafness and deaf-mutism occurring after birth, but in consequence of hereditary predisposition or other antenatal causes. It is believed that this class will embrace a sufficiently large proportion of the so-called adventitious class to make the congenital class and the congenito-adventitious class added together about one-half or more of the whole and chargeable to antenatal causes—arrested development or malformation; maternal impressions; improper or consanguineous marriages; scrofula; parental conditions; and heredity—race, altitude and en-

vironment, scrofulous and tubercular diatheses, deaf relatives, and the transmission of defects, malformations and acquired characters.

STATISTICAL TABLES—CENSUS 1900.

The following statistical tables I have compiled from the special report (1906) relating to the Deaf and the Blind made by Dr. Alexander Graham Bell in accordance with an act of Congress and based upon the census returns of 1900, which have been made more complete by inquiry and correspondence addressed to individuals under the direction of Dr. Bell. All figures are to be considered as for the year 1900 and the percentages relating to the effect of causes upon the ear refer to the figures for the United States.

CAUSES AND AGE DEAFNESS OCCURRED.

In this report 89,287 cases are listed as to causes as follows: Classified cases, 47,967; unclassified cases, 31,205; and unknown cases, 10,115. It was found (classified cases) that more than 90 per cent. of the deafness from scarlet fever, meningitis, and brain fever, more than 75 per cent. of the deafness due to measles, and over 65 per cent. of the deafness due to disease of the ear occurred in childhood (under 20 years); that more than 60 per cent. of the deafness from influenza, catarrh and colds occurred in adult life (over 20 years); that 65 per cent. of the cases due to brain fever occur before the age of 5 years; that meningitis produces deafness chiefly before the age of 5, scarlet fever before the age of 10, malarial fever and quinine, and typhoid fever between the ages of 15 and 40, catarrh between the ages of 15 and 60 (in most cases occurring over 20 and being the only conspicuous cause between 40 and 60) and catarrh and old age (the latter chiefly) between the ages of 60 and 80.

Among the unclassified cases (31,205) 14,472 were born deaf, the remainder (16,733) becoming deaf through various causes, such as old age, military service, accidents, "sickness" and "fevers," etc., about 65 per cent. of the

cases occurring among adults, although over 70 per cent. of the deafness due to fever, over 65 per cent. of the cases due to accidents, and over 60 per cent. of the cases due to sickness, occurred during childhood.

CAUSES AND DEGREE OF DEAFNESS.

Concerning causes and degrees of deafness, it appears that affections of the internal ear result chiefly in total deafness and of the middle ear, chiefly in partial deafness; that affections of the auditory nerve and suppurative affections of the middle ear result chiefly in total deafness while non-suppurative, or catarrhal, affections of the middle ear and labyrinthine affections result chiefly in partial deafness; that of the diseases affecting the middle ear scarlet fever seems to be the only one producing total deafness in a majority of cases; that catarrh produces chiefly partial deafness, more than 80 per cent. of those deaf from influenza, catarrh, or colds being only partially deaf; that of the diseases affecting the internal ear, meningitis and brain fever produce chiefly total deafness, more than 80 per cent. of those deaf from these causes and congenitally so, being totally deaf; that among those deaf from affections of the external ear (impacted cerumen, foreign bodies in ear and miscellaneous causes) 55 per cent. of the cases occurred during childhood, 45 per cent. during adult life, there being total deafness in 23 per cent. of the cases and partial deafness in 77 per cent.

ABILITY TO SPEAK.

	INDIANA.			UNITED STATES.		
	Well.	Imper- fectly.	Not at all	Well.	Imper- fectly.	Not at all.
Total deafness under 20	195	236	1,056	4,578	5,657	22,913
Total deafness over 20	115	3	4	3,203	161	119
Age unknown	8	2	19	246	99	450
Partial deafness under 20	496	92	18	13,486	2,888	774
Partial deafness over 20	1,281	12	6	31,924	457	60
Age unknown	61	3		2,064	155	53
Totals	2,156	348	1,103	55,501	9,417	24,369

"* * * It will thus be seen that the ability to speak (whether well, imperfectly or not at all) is largely dependent upon the period of life when the deafness occurred (whether under twenty years or over), and upon the degree of deafness (whether total or partial). A correlation exists between these three elements. * * * Speaking broadly, about one-third of the deaf who speak well lost hearing before they were 20 years old, one-third between 20 and 40, and one-third after reaching 40. Of the deaf who speak imperfectly or not at all, most lost hearing at a very early age—before they were five—and practically all became deaf before they were twenty.

"Comparatively few of the totally deaf speak well, and comparatively few of the partially deaf speak imperfectly or not at all. The deaf and dumb consist mainly of persons totally deaf from early childhood—under 5. The deaf who speak well consist mainly of persons who became partially deaf in adult life. The deaf who speak imperfectly form an intermediate class, more closely affiliated with the deaf and dumb than those who speak well."—Alexander Graham Bell, in Census Report, 1906.

RATIO OF DEAF TO POPULATION.

The ratio of the deaf to the general population is greater in Indiana than in any other State or Territory, excepting Maine and the District of Columbia. In the former there is a high rate of congenital deafness; in the latter a large attendance of students from all parts of the United States at the Columbia Institution for the Deaf. In Indiana the percentage of deaf (2,093, those losing hearing under twenty years old) to each 1,000 of general population was in 1900, when the census was taken, .832, and in surrounding States as follows: Kentucky, .801; Michigan, .778; Ohio, .749; Illinois, .713. In the United States the percentage was .662

only. Indiana therefore had .170 per cent. more per thousand than the general average for the United States, and .692 more than Wyoming, which had the smallest percentage in 1900.

PROFESSIONAL GATHERINGS.

On January 5, 1906, the annual meeting of the Board of Directors of the American Association to Promote the Teaching of Speech to the Deaf was held in Washington. At this meeting Dr. Alexander Graham Bell presented to the Association the Washington residence of his father, the late Professor Alexander Melville Bell, together with certain stocks and bonds, aggregating \$75,000 in value, with the wish that this gift be used in establishing a memorial in honor of his father, and should be devoted largely to the work of training teachers of speech and to the perpetuation of the system of "Visible Speech" of which his father was

the inventor. The gift was accepted by the Board with appropriate resolutions and the writer was appointed as one of the committee to receive the gift, subject to conditions imposed by the donor, and also a member of the permanent committee to be known as the "Committee on the Melville Bell Memorial Fund." He was also named as a member of the committee on programme for the summer meeting of the Association, to be held during the summer vacation period.

THE WORK IN CUBA AND CHINA.

At the directors' meeting the writer discussed the status of educational work with the deaf in foreign lands, especially in Cuba and in China, in both of which countries efforts were now making for the establishment of schools for the deaf. As president of the Conference of Superintendents and Principals of American Schools for the Deaf, he had written to His Excellency, the President of the Cuban Republic, begging his earnest sympathy and active co-operation in furthering the movement. He also spoke of the situation in China, with about four hundred thousand deaf persons, adults and adolescents, who have grown up or are growing up in ignorance and darkness, without regard and with no effort in their behalf, except upon the part of Mrs. Annetta Thompson Mills, an American woman, who had organized the first and only school for the deaf in all China, a small one at Chifu, wherein fifteen young boys were receiving an education, and the continuance of which was dependent upon contributions. It was pointed out that the small sum of fifty dollars, American money, would defray all expenses for food, clothing, tuition, etc., for one pupil for one year in the Chifu school, and a resolution was presented and passed unanimously commending this little school at Chifu and its worthy guide and constant protectress, to the humane and considerate sympathy and support of all benevolently inclined people of our land. And the writer wishes to add now that he will be pleased to receive and promptly remit any contribution sent him for the purpose.

SEVENTH SUMMER MEETING.

During the summer vacation the seventh summer meeting of the Association arranged for in January was held at the Western Pennsylvania School for the Deaf, Edgewood Park, Pittsburgh, August 25-31. The meeting was a large and enthusiastic one, with members in attendance from thirty states and fifty-one schools and institutions in the United States and Canada. Many addresses were made upon various phases of the work of educating the deaf, especially along the line of instruction in and by means of speech, speech-reading, and visible speech. While our own peculiar work will always remain a special one in some degree, still it is in very large part identical with the educational work provided for normal children, and for this reason a number of outside educators and noted specialists were in attendance at this meeting as lecturers and instructors. Among the most valuable papers presented to the meeting was one by Miss Frances L. Glenn, supervising principal of oral work in the Indiana School, upon the subject, "Speech and Speech-reading in Primary Classes," which was carefully listened to and highly spoken of.

At this meeting the writer delivered an address upon "Defects of Childhood" (printed in full in a subsequent part of this report) and spoke also of the matter of pensions for old teachers of the deaf with long years of self-sacrificing service back of them and urged the appointment of a committee to take up the matter in connection with the Carnegie Foundation Fund. A resolution was passed to this effect and the following committee was appointed for the purpose: Richard O. Johnson, Edmund Lyon, Alexander Graham Bell and A. L. E. Crouter, *ex officio*.

THE NEW INSTITUTION.

Continuing the story of the building of the new Institution upon a new site of eighty acres, four miles north of the center of Indianapolis, reference to which has been made in detail in the last two annual reports of the Institution, it is to be reported further that the plans and specifications

for the various buildings, twenty-two in number, were completed and accepted by the commission in May last and advertisement made in various papers published within and without the State asking that competitive proposals for the erection and completion of the buildings be submitted to the commission on July 10, 1906. At this time a number of proposals on each line of work were received, and later award of contracts was made as follows:

Heinzmann Bros., general construction	\$710,200 00
Woollen & Callon, heating	41,022 50
Woollen & Callon, mechanical equipment	71,770 00
Sanborn & Marsh, electrical wiring	18,565 00
*J. S. Farrell & Co., plumbing	74,657 00
Total contracts	\$916,214 50

All contracts made and entered into by the commission were of two-fold nature in that, in a general way, they were positive, absolute and unconditional as to the construction, mechanical equipment, heating, electric wiring and plumbing of schoolhouse, dining-hall and kitchen-bakery, and power-house; and wholly conditional upon ratification by the General Assembly as to the construction, mechanical equipment, heating, electric wiring and plumbing of the remaining buildings.

The schoolhouse, under the contract, must be enclosed on or before January 15 next, and it and the dining-hall and kitchen-bakery and the power-house must be completed by October 25, 1907. Upon confirmation by the General Assembly of the conditional contracts all of the other buildings must be completed on or before June 1, 1908.

Ground was broken for the first building, the school house, on Saturday morning, August 25, 1906, the first shovelful of earth being thrown by the writer, and at the present time (November 30) the concrete foundations are complete and work is under way on the other two buildings.

It is estimated that additional requirements and expenses to complete the Institution, including grading, sewers,

*On July 10, all proposals on plumbing were rejected and new proposals called for. Later, on October 17, proposals were again received and again rejected. On November 8, proposals were received a third time and award finally made to J. S. Farrell & Co.

walks, driveways, fencing, furniture equipment, outside lighting, fire and water systems, architects' fees, and miscellaneous matters, will amount to \$128,500.

In this connection it may be stated that the amount realized from the sale of our present site, with interest, etc., to October 31, 1906, is \$204,196.94. The difference between this amount and the total heretofore appropriated for building (\$315,000) is \$110,803.06, which stands as the State's appropriation at this time from the general fund for the purpose of building a new State School for the Deaf, which will stand as one of the State's monuments of honor to the cause of education until the close of the century.

APPROPRIATIONS AND EXPENDITURES.

The appropriations, expenditures, balances unexpended, and returns made to the general fund of the State treasury for the fiscal year will be shown in Exhibit No. 1, following, and itemized accounts of expenditures, to whom paid and when, and concerning clothing furnished, cash earnings received, etc., are shown in other succeeding exhibits.

The regular and specific (excess maintenance) appropriations amounted in aggregate to \$75,519.45, the total expenditures to \$70,577.06, leaving unexpended \$4,942.39. This unexpended balance, together with \$948.38, expended from our funds and to be repaid to the State by counties for clothing furnished indigent pupils, and \$759.36 cash earnings received, amounting in total to \$6,650.13, was returned to the State's general fund and must stand to the credit of the Institution against the total appropriation of \$75,519.45, thus leaving the net cost to the State, \$68,869.32, or \$219.31 per capita.

Under the law allowing us \$195 per capita per annum for each pupil present over a daily average of 322 each month, there was an excess appropriation (included above) granted during the year amounting to \$19.45 for the months of November and December, 1905.

NEEDS OF THE INSTITUTION.

The regular appropriations for Maintenance, Industries and Repairs, for the current fiscal year ending October 31, 1907, are established, it being the second year of the biennial term for which appropriations were made by the General Assembly of 1905. These appropriations as made, stand as follows:

For maintenance	\$70,000 00
Industries	4,500 00
Repairs	1,000 00

And in addition thereto, for Maintenance, \$195.00 per capita per annum for each pupil present over a daily average of 322 each month.

For the current year, these amounts will not be sufficient because of the rise in values of all kinds and certain facts named below, and should be increased by specific allowance to the following amounts:

For maintenance	\$73,000 00
Industries	5,000 00
Repairs	1,500 00

While \$4,343.81 was returned to the General Fund as unexpended from last year's Maintenance fund, it is to be borne in mind that no steam coal was bought and stacked during the last two months of the year, as is usually done, at a cost of \$1,500.00; and further, that because of the annual session beginning October 1, later this scholastic year than usual, no salaries were paid the teachers for one-half the month of September, as is usually done, this amounting to \$1,238.77. Adding these two items together we have \$2,738.77, which constitutes an excess to be paid out of the appropriation for the current fiscal year, for the usual amount of fuel must be bought and used and the teachers must be paid an annual salary covering the school year. Then still further, on September 1, for officers, attendants, artisans, and domestics, and on October 1, for teachers, an increase of salaries and wages was given, which in total for the year will amount to nearly \$3,000.00. This increase became necessary because of the high cost of living ex-

penses and in order to retain the services of employes. In this connection, I may add that I feel another increase of salaries and wages to certain officers, teachers, attendants, artisans and domestics will be necessary during the coming year, for some of them are justly entitled to more than they now receive. The question of employes in our public institutions is becoming a serious one and to obtain and retain competent assistants, especially of domestic nature, better wages must be paid. Old conditions no longer obtain. Positions in our public institutions are not eagerly sought, as heretofore. A higher grade of employes is demanded and much expected of them during long and unusual hours of daily service, seven days in the week. Political positions are of the past, business service is required and competency is demanded. And the result is that the institution now seeks the worker instead of the worker seeking the institution, and the inevitable demand is better pay for competency, which is real economy when the outcome of work of any kind is considered.

From the above, it will be seen that \$5,738.77 in three items alone (to say nothing of the increase in price of commodities generally) will be thrown upon the current year's appropriation, or \$1,394.96 more than was returned unexpended October 31. We therefore ask that the present appropriation be increased by specific appropriation of \$3,000.00.

The unexpended appropriation for Industries, October 31, was \$578.32. During the past year our tinshop was not in operation, for the reason that a suitable instructor in the work could not be secured. It is hoped to find such a one this year, and his salary and shop material would more than wipe out the unexpended balance referred to. We therefore ask that the present appropriation be increased by specific appropriation of \$500.00.

For the past three years, the annual appropriation for repairs has been \$1,000.00, which is \$3,000 less than formerly. This reduction was made upon the theory that but small repairs would be needed upon buildings and grounds soon to be vacated. We have now been here three years

with scant appropriation for repairs, and must certainly remain here two years longer. The whole place is old and rapidly deteriorating. The buildings and grounds should be kept in habitable and presentable condition and \$1,000, under present conditions, is very inadequate. We therefore ask that the present appropriation be increased by specific appropriation of \$500.00.

APPROPRIATIONS 1907-1909.

Concerning appropriations for the biennial term of November 1, 1907, to November 1, 1909, it is to be noted that for the first year of the term we shall still be in our present location with the attendance of pupils during the scholastic year limited to about 325, our present limitation; during the second year of the term we hope to be in the new location with greatly enlarged facilities in every way, especially in the industrial department, and with an attendance during the school year of probably 375 pupils, necessitating greater expense and larger appropriations. We therefore ask that the regular appropriations be made as follows:

For first year of biennial term, November 1, 1907-November 1, 1908—

Maintenance	\$73,000 00
Industries	5,000 00
Repairs	1,500 00

For second year of biennial term, November 1, 1908-November 1, 1909—

Maintenance	\$83,000 00
Industries	8,000 00
Repairs	3,000 00

In the light of the past record of the management of this Institution for economical financial dealings consistent with good results, we feel justified in asking the above appropriations, with the belief that the Institutional Legislative Committee (with which a copy of this section of the report has been filed) knows full well that for every dollar expended the State will receive full value, and that not a dollar will be expended where unnecessary, but will be returned as unexpended appropriation at the end of the year, as has been so frequently done heretofore.

COMPARISON OF CLASSIFIED EXPENDITURES.

For Years Ending October 31.

CONCLUSION.

In conclusion, your attention is called to Course of Study in Detail, to Rules Concerning Admissions, to a statement showing Pupils by Counties, to Roster of Pupils, and to Exhibits 1 to 11, inclusive, giving classified and itemized statements of a fiscal nature for the year ending October 31, 1906, all of which are hereinafter set out and made part of this report.

Respectfully submitted,

RICHARD O. JOHNSON,
Superintendent

DEFECTS OF CHILDHOOD.*

In the daily papers of a few days ago was an account of Dr. S. Weir Mitchell and his connection with a "new" movement in Philadelphia for surgical operation upon so-called delinquent children for the purpose of their reformation, etc., and especial reference was made to adenoid growths (pharyngeal or tubal tonsils) and defective vision requiring surgical interference and treatment. Nothing was said concerning enlarged faucial tonsils and defective teeth, but surely they must have been considered by those in charge of such a praiseworthy movement. For a number of years these four defects have been pretty thoroughly discussed by specialists within and without the medical profession, for their frequency and consequent evil results are truly alarming to those who know of their prevalence.

The average parent sees not much further than his own family—and he sees not clearly his own. The inevitable results of these defects referred to may present themselves, it is true, but, while deplored, they are considered "natural and to be expected" in some way and nothing is done for relief—therein lies the pity! The child may die from these defects (other causes assigned), very frequently does, but living, he suffers mentally, physically and, quite often, morally, and too often the resultant "sin" is visited by unjust judgment and wicked punishment.

ENLARGED TONSILS.

Pharyngeal tonsils (adenoid growths), a spongy, blood-filled mass in the naso-pharynx, and enlarged faucial tonsils tend to closure of the pharyngeal opening of the short eustachian tube (about one and one-half inches long) leading from the postnasal space to the middle ear cavity, thus preventing its proper ventilation and drainage. This causes abnormal atmospheric pressure upon the ear-drum from without, produces inflammation within the middle ear cavity, and the formation of pus for want of proper ventilation and drainage through the tube, resulting in abscess and puncture of the ear-drum or escape into the inner ear, causing nerve deafness, and a long list of other complaints.

This tonsillar enlargement is an important factor in disease, interfering decidedly with nasal, or proper and healthful, respiration, with the perfect mobility of the uvula and with perfect phonation. This enlargement commonly results in inflammation, tonsilitis, quinsy, rheumatism, etc., affects the general health, and through extension of inflammation to and partial closure of the eustachian tube leading to the ear, causes partial or total deafness. The claim has been made that tonsilitis is a local-

*Address delivered by Richard O. Johnson at the Seventh Summer Meeting of the American Association to Promote the Teaching of Speech to the Deaf, Edgewood Park, Pa., August 25-31, 1906.

ized form of rheumatism, that recurrent attacks thereof are due to germ infection of the faucial tonsils, and further that tuberculosis may be introduced into the system by germ action along the glands leading from the tonsils to the lungs. To say the least of it, this enlargement is an aggravating source of much discomfort, and excision most certainly will result in better health conditions and greater physical development, if nothing more.

ADENOID GROWTHS—SYMPTOMS AND EVIL RESULTS.

Symptoms of adenoid growths are numerous and vary in different children, but the following are among the more frequent ones: Repeated colds in the head, periodical headache, difficult breathing, mouth breathing, thick speech, hoarseness, difficult deglutition, inability to blow the nose, discharges from the nose and ear, cough, croup, tonsillitis, asthma, intermittent spells of deafness upon slight exposure, nervousness, mental dullness, night sweats, feverish conditions, frequent periods of malaise, epileptic seizures, and attacks of nausea, gagging and vomiting which are often attributed to digestive disturbances. Physically, the face is more or less deformed, the hard palate high arched with irregular teeth, the nose sometimes improperly developed inside and out, the glands of the neck larger than normal, and the chest deformed. In nearly all cases of adenoid growths the faucial tonsils are enlarged and it has been asserted that these enlarged tonsils are proof positive of adenoid growths without further examination. With these enlarged faucial tonsils are most likely thickened faucial pillars to which the tonsils may adhere, thickened uvula and enlarged follicles.

Slight adenoid tissue is probably natural to all children and soon disappears; it is the enlarged growth that causes trouble. Even this will disappear from the twelfth to the sixteenth year, but in the meantime irreparable damage has been done—the child has become a confirmed mouth breather, the roof of the mouth is of high and irregular arch, interfering with correct articulation, the teeth are irregular, the voice is affected, the bones of the face have assumed abnormal position, and the open mouth and vacant expression and lack of full mental and physical development present the “adenoid face” and a general picture of stupidity. Deafness of total or less degree may also be present—and generally it occurs.

It should be written in large letters that adenoids and tonsillar enlargement unattended to will result in disease, deafness and impaired growth, both physical and mental, and the lack of moral stamina.

CAUSE AND REMEDY.

Investigation as to cause of this trouble does not lead to satisfactory results. “Adenoid condition,” writes a well-known specialist, “is an excessive activity of the lymphoid tissue of the pharynx, at first normal, stimulated by constant irritation from particles of dust or secretions with mild infection, the rapidity and development of the growth being governed by the atmospheric, climatic and constitutional conditions and by personal hygiene.”

Whatever the cause, the evil results are certain and patent to all; but just as certain are the good results following surgical operation if taken in time—the child thrives and grows as never before, the stupid, vacant facial expression gradually disappears, nasal breathing restores a more normal physiognomy and nature seems delighted at being rid of offending matter. If the hearing function has been affected, a change for the better occurs, in many cases with complete restoration of the hearing power. Whatever the cause, surgical interference is absolutely and always demanded of the parent, who should ever keep in mind this dictum of one who has had to do with thousands of adenoid cases: There is no condition or diathesis or disease which can abort the good, distort the beautiful, and prostitute the useful, like the neglect of the adenoid condition; there is no medical or surgical transaction which will call forth more expression of gratitude and praise for the physician than this operation, when successfully performed.

DISEASES OF THE EAR.

It may be stated as a general proposition: Most ear diseases are caused by affections of the naso-pharynx, and a perfect hearing depends upon free ventilation of the middle ear. Investigation into the causes of mortality discloses the fact that a little over one-half of one per cent. of deaths results from ear diseases—one in 180. It has been emphasized by a recent writer that there is a direct relationship between the ear and certain forms of epilepsy, gastroenteritis and many other diseases, and that many disturbances of health supposed to have their origin in brain, lungs, bowels and other organs are caused by pent up secretions of the middle ear. Chronic aural suppuration, he adds, is often symptomless, so far as the ear is concerned, and unsuspected, and cites the experience of Ponfick of Breslau, professor of pathology, who made an examination of the middle ears of 100 consecutive cases of infants dead under three years of age and who were supposed to have died of various diseases and among whom only nine had been supposed to have had any ear trouble showing rupture of the membrane or other external symptoms of ear disease. In these cases Ponfick found 168 diseased tympana, 77 ambilateral and 14 unilateral. Evidence similar to that of Ponfick is given by Simmonds (*Archives of Otology*, October, 1898), who states that in 133 autopsies in nursing infants the middle ear was free from exudation in only five cases. Many of these infants above referred to would have become deaf and deaf-mute, no doubt, had they lived. How important, then, that there should be careful examination of the naso-pharynx, of the membrana tympani, and for middle ear inflammation, correct diagnosis and prompt and efficient treatment by means of excision of enlarged faucial and pharyngeal tonsils and incision of the membrane for proper exudation if inflammation be found, in all diseases of infancy and childhood. Proper attention and treatment will probably save the child's life and preserve its hearing and speech, for it is a fact that a child losing its hearing under seven years of age will almost surely lose its acquired language unless strenuous efforts be made to preserve it.

DEAFNESS IS GENERAL.

The prevalence of defective hearing among the pupils of our public schools is far greater than is generally known. Dr. Bryan, of the Indiana State University, reported in the *Inland Educator* some years ago the results of an examination of the hearing of twenty thousand public-school children and stated that one investigator found two per cent. of defectives, while eleven others found from 13 to 30 per cent. of defectives. At the Minneapolis meeting of the National Educational Association (1902) it was stated that a large number of pupils in the public schools had defective hearing and were backward because of this defect; that the number having defective hearing probably outnumbered the total deaf-mute population and were simply drifting along, their teachers not knowing what to do with them. At the Boston meeting of the Association (1903) an incomplete report upon this matter was made to the "Department of Special Education," showing that in the public schools of six cities an examination had been made of 57,072 pupils. Of this whole number, 2,067, or a little over three and one-half per cent., were found to have marked defective hearing. In the reports of this examination, minor defects were ignored and only the most pronounced cases included. The percentages ranged from 2.0 to 6.6, the former at Cleveland, Ohio, the latter at Utica, N. Y., where 406 pupils out of 6,113 were found who could hear only at a distance less than one-third the average distance for the class, and 399 additional not included in the percentage, who heard one-third to one-half the average distance. In Chicago, an examination was made of 6,729 school children, 6.5 per cent. of whom were found to have marked defect of hearing. Of the total number, however, 16 per cent. were found to have defective hearing of greater or less degree, 6.5 per cent. defective in both ears and 9.5 per cent. in either right or left ear. In Providence, R. I., it was reported that about 10 per cent. of the pupils had defective hearing, that it was more common with boys than girls, and that adenoid growths were common. Adenoid growths and mouth-breathing were reported from nearly all places. In his report for 1900, Superintendent Southworth, of the Somerville, Mass., schools, says:

"The subject of the hearing of school children is also beginning to receive the attention it deserves, and investigations in many places have tended to establish the following points:

"1. At least one child out of every five has some defect in one or both ears.

"2. In the majority of cases neither parent, teacher, nor child is aware of the defect.

"3. Children defective in hearing are usually counted careless, inattentive, or positively stupid by parents and teachers, who are ignorant of the real cause. Such children are often kept two or more years in the same grade, and, being the largest children, are not infrequently given seats in the rear of the room, where their chances of hearing are reduced to a minimum. This point is so important that it deserves special notice. Out of 961 children examined in two cities, 176 were found to have defective hearing, while only two out of the 176 were known to be deaf by their teachers.

"4. A child who is hard of hearing can hear better at certain times than at others. This fact often leads parents and teachers to misjudge

a child. The remark is often heard, "Don't tell me Johnnie is deaf, he can hear as well as anybody when he wants to."

DEFECTIVE VISION.

Along with this defective hearing of our public-school children comes defective vision for the consideration of parents, educators and skilled specialists. It frequently happens that both ear and eye are affected by a common cause—for instance, exanthematous diseases. A partially deadened ear requires a sharp eye, defective sight a keen ear, as complements. Where both ear and eye indicate deficiency, the condition is a deplorable one, the more so when the defects are unrecognized and no examination made or treatment given which would remove or ameliorate in large degree either one or both defects. Out of 312 pupils in the Indiana State School for the Deaf who were examined last spring, eighty (25.6 per cent.) were found with defective vision in greater or less degree. Of this number but eighteen were wearing glasses provided by parents; neither parents nor children were conscious of existing defect. Of the eighty with defective vision, twenty-nine were born deaf (69 per cent. total deafness) and fifty-one suffered deafness through sickness and disease (51 per cent. total deafness). Comparing the percentages of defective sight of those born deaf and of those losing hearing after birth, the latter is 1.3 per cent. higher (24.8—26.1).

Defective vision, causing suffering from headache, blurring, pain on studying at night, near-sightedness, defective color perception, etc., is as frequently overlooked by both teacher and pupil as is defective hearing. In a report made to the Boston meeting of the National Educational Association above referred to, an examination of 34,426 school children in five cities showed marked defective vision in 4,603, or nearly 13.5 per cent. The percentages ranged from 7.7 to 19.1, the former at Bayonne, N. J. (4,610 examined), the latter at Worcester, Mass. (11,953 examined). As with the deaf, minor defects were ignored and only the most pronounced cases included. In Providence, R. I., a report from the director of physical exercise showed that 25 per cent. of the school population had defective vision; that 40 per cent. of this proportion wore glasses and were backward in studies because of poor sight; that Jewish, American and Irish children, in the order named, are more prone to defective vision than other classes, and that Italian, Portuguese, Syrian, Armenian and negro children are practically free therefrom.

THE NORMAL EYE AND EAR.

Upon examination many persons are found whose hearing and eyesight, one or both, are defective, yet they are almost indignant if any suggestion of this deficiency is made to them. The explanation of this is to be sought in the fact that among civilized surroundings the normal ear and the normal eye are rarely called upon to exert their functions to the fullest possible extent. It is, therefore, evident that a considerable amount of hearing, or of sight, can be lost without any corresponding appreciation of the fact. This loss, however, implies something more than subtraction from the working power of a single sense. That impairment of either the hearing or sight should be an inconvenience is readily understandable; that it can make so large a demand upon the nervous energy as

to be a source of fatigue needs personal experience or observation for its full appreciation. Alarming large percentages of backward and feeble-minded children upon examination have been found to be afflicted with deformities of the eyes, impairing vision, all of whom evidenced marked improvement, mentally and physically, when defects of sight had been corrected. In many instances insubordination, truancy and viciousness have been successfully overcome by the prescription of correct glasses. Our reformatories, insane hospitals and inebriate retreats, it has been stated, show large percentages of visual defects in the inmates and that probably the deformed eye transmitting to the brain distorted images has exerted a demoralizing influence upon the mentality.

I am convinced that a uniform and thorough examination of our public school children throughout the country would disclose an alarmingly large proportion of pupils who lack the proper perception of speech-sound, who are practically deaf to certain elementary sounds, and to whom ordinarily modulated speech must seem in consequence a confused jumble or unintelligible mumbling. I am also certain that it would be found that defective eyesight is more prevalent and largely increasing. Without knowledge on the part of teacher and pupil of the latter's deficiency, the child stumbles on through the grades displaying that which is unjustly styled natural stupidity. The remedy for such a state of affairs is plain and simple. There should be a State law everywhere requiring an examination of the hearing and eyesight of all school children at least once in three years, as is now the law of the State of Connecticut; there would then come about better knowledge of possibilities of prevention of ear and eye deficiency, proper treatment would be prescribed and these most common evils reduced to a minimum—nervous exhaustion would be relieved, better health result, and greater educational progress made.

DECAYED TEETH.

Another thing that few parents give heed to is decayed teeth, and yet these give rise to a long list of ailments. Decayed or decaying teeth are not only unsightly, a cause of foul breath, and the source of much excruciating pain, but a most prolific cause of digestive disorders leading to serious physical illness. When the pain of aching teeth in the child becomes too severe home remedies are administered for the symptom—the real cause of the ache is overlooked and nothing done therefor—and upon the temporary subsidence of the symptom (pain) the matter is dropped from mind until another outbreak from the same continuing cause; in the meantime the degeneration of diseased teeth is constant, and in ninety-nine cases out of one hundred, absolutely nothing is done to arrest the decay and for the preservation of the teeth. The aid of a dentist is not sought until too late, then in too many cases, only for the purpose of extraction; and in this connection it may be well to add—that early or late, a tooth should never be extracted that dentistry may save.

DEFECTS THROUGH SCHOOL COURSE.

Professor Krauskopf, of the Chicago Child Study Laboratory, in two articles on sight and hearing, in the *Journal of Adolescence*, shows that upon first entrance to school at six years of age 32 per cent. of the children were found with defective sight, and 26 per cent. with defective hear-

ing; that from this time there is a very rapid increase in the percentage of defectives until the ninth year, then as rapid a decrease until the thirteenth year, then again a slight rise until at the close of the high school the percentage of defectives is about the same as upon entrance to school. "The great fact brought out by these Chicago investigations," writes Oscar Chrisman, professor of paidology, Ohio University, "is the very rapid increase of defective sight and hearing in the early school years of the child, which culminates not far from the ninth year. This is a remarkable time in the life of the child, for other troubles show strongest about this year. At this time the brain has about reached its full weight, and in its development is changing from increase in size to increase in function. This is also the time of the greatest susceptibility to fatigue in the life of the child; for near this year there is a sudden growth, which is not shared by the heart, so that it does not keep pace in growth, while the extra strain on it causes dilation and great fatigue when exertion forces the heart to do more work than it can rightly accomplish. The maximum weight of the spleen in proportion to the body comes at this time, but just what that means is not determined. At this year, too, the child has yet about half of his temporary teeth remaining, most of which are in bad condition, thus preventing proper mastication of food, and frequently keeping the child from eating sufficient amount of food because of pain from the bad teeth. All these conditions lower the general tone of the child's system, and, with the adenoid and catarrhal growths and the various infectious diseases of childhood, act upon these two senses of sight and hearing so as to increase the bad condition which school work aggravates."

DUTIES OF PARENT OR STATE.

With such facts as the above before them for guidance, it is the bounden duty of parents to give heed to their children's welfare by having the adenoid growth and the enlarged faucial tonsil removed as early as possible—to have the eyesight safeguarded by the prescription of correct glasses, and to have the teeth cared for in proper manner. Having brought the child into the world the parents should be compelled by law to protect it against at least these few removable evils, to the end that sound minds and sound bodies shall combine for the good of both family and State. And if parents are unable or neglect to do these things, then the State itself should do so for its own protection. Just these things, among others, Dr. S. Weir Mitchell and those associated with him are doing for the so-called delinquent children of Philadelphia. Can any one doubt that children suffering from the evil results of one or more of the four defects named should frequently, yes, generally, be left behind in the race, and, discouraged, become indifferent and acquire a tendency down the scale to delinquency and perhaps, depravity? Surgical operation and special treatment upon delinquents along these lines is all right, but why not surgical operation and special treatment upon the growing child before the delinquent stage is reached? Let parents assume the responsibility which is theirs by the law of God, but should they fail in this, through ignorance, negligence or for any other reason, then let it be assumed by some one else—let not the child suffer and be condemned to follow the path of weaklings when the cause is so easily removed.

* COURSE OF STUDY IN OUTLINE.

PRIMARY GRADES.

Grade 1—

Language—Past, present and future tenses, active voice, with auxiliaries be and have; positive, negative and interrogative; vocabulary, parts of speech and sentence models as prescribed. Arithmetic—Notation 1 to 31, with Arabic and number-words; addition and subtraction to 10, teaching plus and minus signs; mental and written. Penmanship—Instruction with pencil and crayon, followed by pen and ink exercises. Letter Writing. Good Morals and Gentle Manners. Object and Observation Lessons.

Grade 2—

Language—First grade verb forms and sentence models continued with added auxiliaries; present progressive; present habitual; conjugation; vocabulary, parts of speech and sentence models as prescribed. Arithmetic—Notation 1 to 100, Arabic and number-words; Romans and ordinals to 12; addition and subtraction to 100; mental and written. Penmanship—Copy-book work, Nos. 1 and 2. Drawing—First principles, black-board, slate and paper; drawing book, No. 1. Letter Writing. Good Morals and Gentle Manners. Object and Observation Lessons.

Grade 3—

Language—First and second grade forms and sentence models with auxiliaries continued; infinitive; imperative mode; conjugation; vocabulary, parts of speech and sentence models as prescribed; journal writing. Arithmetic—Notation 1 to 1000; Arabic and number words, Romans and ordinals to 100 and higher; addition and subtraction; dollars and cents; measuring; mental and written. Geography—Introductory work by teacher; positions, cardinal points, locations, plans, etc. Penmanship—Copy-book work, Nos. 3 and 4. Drawing—Drawing books, Nos. 2 and 3. Letter Writing. Good Morals and Gentle Manners. Object and Observation Lessons.

Grade 4—

Language—Previous verb forms and sentence models continued; present perfect tense; passive voice; conjugation; vocabulary, parts of speech and sentence models as prescribed, introducing idioms; journal writing. Arithmetic—Numbers above 1000, with Arabic and number words, Romans and ordinals to correspond; addition and subtraction, multiplication and division, with not more than two figures in multiplier and divisor, teaching multiplication and division signs; aliquot parts; dollars and cents; measuring; buying and selling; mental and written. Geography—Third grade work continued and enlarged, concerning institution, city, county and State, showing principal towns, rivers, lines of railway, highlands, lowlands, mineral and agricultural products; map drawing. Penmanship—Copy-book work, Nos. 5 and 6. Drawing—Drawing books, Nos.

* Elaborated in form for primary grades in "Course Limitations," wherein is detailed the monthly development and limitations in language, arithmetic and geography.

4 and 5. Letter Writing. Good Morals and Gentle Manners. Object and Observation Lessons.

*Grade 5—

Language—Previous verb forms and sentence models continued; past perfect tense; present participle; systematic instruction in idioms; vocabulary, parts of speech and sentence models as prescribed; journal writing. Arithmetic—Practical problems in the four fundamental rules, introducing properties of numbers; weights and measures; United States currency. Geography—First lessons; general division and features of land and water, and form of earth; map drawing. Penmanship—Copy book work, special selection. Drawing—Drawing books, Nos. 6 and 7. Letter Writing. Good Morals and Gentle Manners. Object and Observation Lessons.

INTERMEDIATE GRADES.

B Grade—

Language—General review of primary-grade verb forms and sentence models; future perfect tense; potential and subjunctive modes; past and past perfect participles; systematic instruction in idioms continued; journal writing. Arithmetic—Cancellation; fractions and decimals begun; United States currency; practical problems in money; bills and accounts. Geography—Elementary mathematical, physical and political; map drawing. History—First and second terms, introductory work by teacher, concerning institution, city, county and State; third term, stories of American history. Drawing—Special selection. Good Morals and Gentle Manners. Object and Observation Lessons.

A Grade—

Language—Grammar, idioms and general reading continued; compositions. Arithmetic—Fractions and decimals completed; denominate numbers and measurements; exercises in commercial forms. Geography—World's mathematical and physical; globe and map studies; map drawing. History—Elementary United States.

ACADEMIC GRADES.

Junior Grade—

Language—Grammar; general reading and idioms continued; compositions. Arithmetic—Percentage, practical problems in profit and loss, commission, insurance, taxes, duties, etc.; exercises in commercial forms. Geography—World's political; map drawing. History—Complete United States and stories of.

Middle Grade—

Language—Grammar and general reading; compositions. Arithmetic—Interest; discount; exchange; partnership; ratio and proportion. History—First and second terms, general history; third term, English; selections, and stories of both. Physiology and Anatomy—"Elements of," and lectures, making use of anatomical models, skeleton, etc.

*The future perfect tense, the potential and subjunctive modes, except as introduced under auxiliaries, and the past and past perfect participles, are to be taken up in the Intermediate Grades.

Senior Grade—

Language—Grammar and literature; compositions. Arithmetic—Analysis; roots; mensuration; general review. Natural Philosophy—Lectures and experiments. Moral Philosophy—Lectures. Civics—Outline in general, United States in particular. Current Events.

*TEXT BOOKS USED.

Grade 1—No books; lesson-papers.

Grade 2—No books; lesson-papers.

Grade 3—First Reader (Cyr); lesson-papers.

Grade 4—Stories for Language Study (Kellogg).
Arithmetic (Original Work by Teacher).
MS. Geography (Teacher).
Lesson-papers.

Grade 5—Stories of Great Americans (Eggleston).
Arithmetic (Original Work by Teacher).
First Lessons in Geography (Monteith).
Lesson-papers.

B Grade—First Lessons in Language, Part I (Tarbell).
Stories of American Life and Adventure (Eggleston).
Elementary Arithmetic (Walsh).
Elementary Geography (Frye).
MS. History (Teacher).
First Book of American History (Eggleston).

A Grade—First Lessons in Language, Part I (Tarbell).
Book of Tales (Edited by Swinton).
Complete Arithmetic (Walsh).
Complete Geography (Frye).
Elementary History of the United States (Quackenbos).

Junior Grade—First Lessons in Language, Part II (Tarbell).
Old Stories of the East (Baldwin).
Complete Arithmetic (Walsh).
Complete Geography (Frye).
History of the United States (Higginson).

Middle Grade—Lessons in Language, Part II (Tarbell).
* Ten Great Events in History (Johonnot).
✓ Complete Arithmetic (Walsh).
General History (Anderson).
English History (Higginson and Channing).
Physiology, "Our Bodies and How We Live" (Blaisdell).

Senior Grade—Lessons in Language, Part II (Tarbell).
Primer of English and American Literature (Clarke).
Shakespearean Primer (Institution edition).
Complete Arithmetic (Walsh).
Natural Philosophy (Cooiey; lectures and experiments).
Moral Philosophy, lectures.
Civics (Townshend's Shorter Course).

* Various other text-books and supplementary readers for reference and general reading are made use of in the different classes.

RULES

CONCERNING THE ADMISSION AND RETENTION OF PUPILS AND WHAT SHALL BE TAUGHT THEM.

1. This Institution is open to all the deaf of the State free of charge, provided they are of suitable age and capacity, and are too deaf to be educated in the common schools.

2. Pupils will be considered of proper school age between the years of eight and twenty-one, but the admission of pupils between the years of seventeen and twenty-one will depend upon circumstances. No child who is idiotic or feeble-minded or who is afflicted with sore eyes, or with a contagious or offensive disease, or who is an invalid so confirmed as to prevent study, or who is in a badly crippled condition and unable to go up and down flights of steps, or who is unable to care for self in a general way, will be received as a pupil.

3. This Institution is in no sense an asylum for the deaf, nor a place of refuge for those who can not talk—neither is it a prison, a reform school, an almshouse, a children's home nor an hospital. It is strictly an educational institution—a school in its widest and best sense, and a part of the common school system of the State, wherein the deaf children of the State receive an education as a matter of right, not as a matter of charity.

4. Applications for the admission of pupils must be made upon the regular blank form of the Institution, which will be furnished the applicant by the Superintendent. All questions on said form must be fully answered, and the requirement of certificates of a physician and of a justice of the peace on the back thereof (that the person seeking admission as a pupil is eligible physically and mentally and is a legal resident of the county named), must be complied with. (See Sec. 2999, R. S. 1901.)

5. No child shall be brought to the school as a pupil until the proper application has been filed with, and acted upon, by the Superintendent, and due notice of admission sent by him to the applicant.

6. Those for whom applications have been made and favorably acted upon will be admitted as pupils on the following conditions: (a) They must be provided with clothing, and brought to the Institution punctually at the time designated by the Superintendent, unless detained at home by sickness. (b) They are to remain in school until the second Wednesday in June of each year. (c) No parent or guardian will be allowed to take a pupil out of school during the session without some very urgent reason. (d) Pupils will not be allowed to go home during the holidays, nor at Easter time, the annual session being a continuous one without a vacation.

7. The annual session of school usually begins on Wednesday of the week preceding the first day of October and closes on the second Wednesday in June. Pupils must report promptly at the beginning of the session. No pupil, unless under extraordinary circumstances, will be received at any time other than at the beginning of the annual session, because of the classes being graded and the work progressive from the first day.

8. The pupils will be sent home to spend the summer vacation on the day following the close of school.

9. The Institution will provide for each pupil regularly admitted, boarding, lodging, washing, superintendence of conduct, manners and physical needs, instruction, school supplies, etc., but will not pay traveling expenses of pupils in coming to or going from the Institution, nor supply them with clothing, except under certain conditions mentioned in Paragraph 12.

10. All traveling expenses of pupils to and from the Institution must be defrayed by their parents, guardians or friends. They are also required to furnish annually to each pupil sent by them a sufficient quantity of suitable clothing to last until the close of the term. (See Sec. 3000, R. S. 1901.) A good, stout trunk-must also be supplied. The name of the pupil must be written in indelible ink upon all articles of clothing, as they are liable to be lost when not so marked. While close and constant attention will be given to the preservation of pupils' clothing the Institution disclaims any responsibility for worn-out, lost or misplaced articles.

11. The applicant must deposit with the Superintendent, when the pupil is admitted, a sum not less than \$5.00 to defray incidental expenses (shoes, repairs, etc.) for said pupil during the year. If any part of said deposit should remain unexpended at the close of the annual session, it will be returned or carried forward to the next session, as the applicant may desire.

12. When it is established that a pupil is in indigent circumstances, or when the parents, guardians or friends are either unable or neglect to furnish the necessary clothing, or to pay the necessary traveling expenses (going from the Institution), then the same will be provided for by the Superintendent in pursuance of the following legislative enactment:

Sec. 3001, R. S. 1901. In all cases where suitable clothing, and means for defraying traveling expenses are not otherwise supplied to the pupils, the same shall be provided by the Superintendent, who shall make out and file with the Treasurer of State accounts therefor, separate in each case, against the respective counties from which the pupils are sent, in an amount not exceeding forty dollars per annum for every such pupil; which accounts shall be severally signed by the Superintendent and attested by the seal of the Institution under his charge; and the Treasurer of State shall charge each account, thus certified, to the county from which the pupil named therein was sent, and credit the amount to the current expense fund of the proper institution.

Sec. 3002, R. S. 1901. The Treasurer of State shall forward each account, so filed with him, to the treasurer of the proper county, who shall cause it to be paid out of the county treasury to the Treasurer of State; and such county shall, in the name of the county, and by suit, if necessary, collect the amount of such account from the parents or estate of such pupil, as the case may be, where there is ability to pay: Provided, That at least three hundred dollars of the property shall be exempt from the payment of such account.

13. The regular course of study in the Institution is so arranged as to cover ten years, and is divided into primary, intermediate and academic courses. The primary and intermediate courses embrace spelling, reading, writing, drawing, arithmetic, geography, history and grammar. The two

courses are divided into seven grades, five primary and two intermediate, and the time required to complete them is seven years. The academic course comprises a three years' course of advanced primary and intermediate work, and of other studies. In addition to the above, a kindergarten department, with two years' instruction, is provided for the younger and selected pupils. The regular kindergarten work for hearing-speaking children is adapted to the needs of the deaf, the second year merging into primary work. The number of years a pupil may remain in school is regulated by a time schedule, and depends upon the mental ability, progress and conduct of the pupil himself. He may remain certainly five years, subject to conditions named in Paragraph 14, and as much longer, up to thirteen years, as his conduct and promotions from year to year may warrant.

14. The Superintendent shall have the power at any time to discharge a pupil from the Institution for inability to receive an education, for non-progression or nonattendance, for violation of the rules of the Institution, or where his retention would prove a detriment to others or to the school. He may also, when he thinks the facts warrant it, extend the period of instruction in individual cases.

15. It is the intention of the Trustees to render the pupils self-supporting in greater or less degree after leaving the Institution, by requiring them to become proficient in some useful trade or occupation, or in the underlying principles of several trades, while in attendance at the Institution. In accordance with this design, all pupils will be required to labor a portion of each day, the girls performing the lighter kinds of housework, cooking, the various kinds of needlework, and dressmaking and millinery in all of their branches; the boys at various trades—typesetting, presswork, carpentry, cabinetmaking, woodturning, painting, glazing, cutting, fitting, making and the repair of shoes, harnessmaking, tinwork, baking, cooking, floriculture, barbering and farming. Pupils will be assigned to one or more of these occupations, or others, as the Superintendent may deem them most fitted for. Drawing, freehand and mechanical, will be taught to all pupils during the first five years, and in the four higher grades all girls and selected boys will be taught sketching, designing, modeling, woodcarving and painting in oil, water colors and pastel, etc.

16. In the education of the deaf there are two methods and one system of instruction generally recognized.

The Manual or French Method (using sign-language, manual alphabet and writing), of which there is a variation that may be called the "Alphabetic," wherein only the manual alphabet and writing are used.

The Oral or German Method (using speech and speech-reading and writing), of which there is a variation that may be called the "Auricular," wherein special attention is given to the development and training of the hearing, when possessed in any degree, by means of which instruction is partially given.

The Combined System (a so-called combination of the two methods).

Some of the leading German instructors, after long years of experience, favor the French Method; some of the French schools have adopted

the German Method, but no country, other than America, has generally adopted the Combined System, which, in justice, should be called the American System.

The general system of instruction used in this institution is known as the American (combined) System, under which all known methods and their variations may be used for the attainment of an object common to all. Speech and speech-reading are regarded as very important, but mental development, and the acquisition of language and general knowledge, are regarded as still more important. It is believed that with a great many of the new pupils now entering, the necessary mental development and acquisition of language and general knowledge may be as well attained by the Oral Method, which results in speech and speech-reading, as by the Manual Method, which precludes this much-to-be-desired result. So far as circumstances permit, such method (or methods) is chosen for each pupil as seems best adapted to his needs and capacity after thorough trial. In short, the rule will be: *Any method for good results—all methods, and wedded to none.*

17. The Institution is nonsectarian, but thorough moral and religious instruction will be given, especially on the Sabbath, the nature of it being general, and such as is accepted by all churches and creeds.

Sec. 3070, R. S. 1901. No sectarian tenets of religion shall be taught in the Institution to any pupil thereof.

18. The parents and friends of the pupils may visit them as often as they wish and whenever they deem it proper, but they should be careful not to abuse this privilege to the harm of the pupil, who must be withdrawn from school room or shop for the purpose. Parents and friends, or those bringing pupils to or taking them away from the Institution, can not be furnished meals or lodging.

19. Being Sec. 3004, R. S. 1901. Whenever it shall be deemed necessary by the proper officers of the Institution in accordance with the by-laws and regulations to have any pupil removed, either temporarily or on account of ill-health, or the vacation of the school, or permanently on account of having completed his course of instruction, or been found disqualified from any cause for a longer continuance in the school, the parents or guardians of such pupil, if he have any, shall promptly remove him upon the requirement of said officers; and, in case he shall not be thus provided for, it shall be the duty of the Superintendent of the Institution to cause him to be removed and delivered to the Trustee of the township where he resided before coming to the Institution; and the expense of such removal shall be refunded in the same manner as provided in Sections 3001 and 3002; and the county treasurer shall charge the same to the proper township and collect it in the manner as provided in aforesaid sections.

20. All business letters or letters of inquiry in regard to pupils or their concerns, or in regard to new pupils whom it may be designed to place in the Institution, must be addressed to the Superintendent, and not to subordinates (officers, teachers, attendants or employes)—otherwise no attention will be paid to such letters.

PUPILS BY COUNTIES.

THE FOLLOWING TABLE SHOWS, BY COUNTIES, THE NUMBER OF PUPILS ADMITTED AND DISCHARGED DURING THE FISCAL YEAR, AND THE NUMBER REMAINING AND ENTITLED TO THE PRIVILEGES OF THE INSTITUTION ON OCTOBER 31, 1906.

COUNTIES.	Admitted.	Discharged.	Remaining.

ROSTER

OF PUPILS IN ATTENDANCE DURING THE FISCAL YEAR END-
ING OCTOBER 31, 1906.

Name.	Year Ad- mitted.	Postoffice.	County.
Abbott, Kate	1903	Algiers	Pike.
Addison, James Walter	1906	Seafield	White.
Albright, William F.	1899	Hope	Bartholomew.
Allen, Otto E.	1904	Linton	Greene.
Allen, Robert W.	1905	Fredricksburg	Washington.
Allen, Leonard H.	1903	Shoals	Martin.
Alley, Rilla R.	1901	Lincoln City	Spencer.
Allman, Lida E.	1899	Michigan City	Laporte.
Allman, Elmer S.	1902	Michigan City	Laporte.
Ambuhl, Dora R.	1903	Indianapolis	Marion.
Amos, Carrie	1903	Sturgis, (Michigan) ...	Lagrange.
Anderson, Geneva	1903	South Bend	St. Joseph.
Anderson, Lorel Glenn	1906	Poling	Jay.
Armstrong, Mary Edith	1906	Union City	Randolph.
Arnot, Pansy G.	1897	Delphi	Carroll.
Badders, Fred	1906	Dunkirk	Jay.
Bartlett, Ralph Martz	1900	Dunkirk	Jay.
Bain, Claude L.	1906	Martinsville	Morgan.
Barrett, C. Dot.	1896	Middletown	Henry.
Barnett, Loretta V.	1905	Kokomo	Howard.
Barr, Estella L.	1893	Indianapolis	Marion.
Barker, Ernest Floyd	1900	Peru	Miami.
Bachelor, Carl E.	1903	Indianapolis	Marion.
Bennett, Harry P.	1896	Patoka	Gibson.
Bettag, Alois	1900	Jasper	Dubois.
Bettag, Paul	1901	Jasper	Dubois.
Bettag, Justina	1906	Jasper	Dubois.
Beyer, Maude M.	1895	Seymour	Jackson.
Bickel, Lorena C.	1906	Floyds Knobs	Floyd.
Bickel, James L.	1904	Hudson	Steuben.
Bissey, Charles B.	1894	Plainville	Daviess.
Billings, Bertie	1906	Columbus	Bartholomew.
Black, Henry C.	1901	Spencer	Owen.
Blackitor, Frank	1903	Ayrshire	Pike.
Blackwood, Turner T.	1900	Sanborn	Knox.
Blose, George W.	1898	Mt. Etna	Huntington.
Boone, Walter	1905	Oaktown	Knox.
Bond, William	1901	Evansville	Vanderburgh.
Bosh, Phoebe G.	1901	Twelve Mile	Cass.
Borinstein, Leah	1897	Indianapolis	Marion.
Brashear, Anna L.	1898	Laconia	Harrison.
Brackall, Hulda	1904	Terre Haute	Vigo.
Bradley, William Francis	1906	Shelburn	Sullivan.
Bragg, Minnie	1905	Noblesville	Hamilton.
Brenton, Ethel	1896	Southport	Marion.
Brenton, Clarence	1897	Southport	Marion.
Bridges, Raymond M.	1898	Franklin	Johnson.
Buhler, Grace D.	1900	Decatur	Adams.
Burch, Frederick E.	1902	Winslow	Pike.
Barford, Elmer J.	1898	Bridgeport	Marion.
Burford, George	1898	Bridgeport	Marion.
Butcher, Joshua A.	1898	Portland	Jay.
Butcher, Lewis F.	1903	Portland	Jay.
Butler, Glenn	1897	Huntington	Huntington.
Byers, Milburn E.	1905	Vincennes	Knox.

ROSTER OF PUPILS—Continued.

Name.	Year Ad- mitted.	Postoffice.	County.
Campbell, Monell	1894	Marion	Grant.
Cannon, Alice M	1899	Petersburg	Pike.
Carr, Edwin	1905	Mitchell	Lawrence.
Carmichael, Glen	1901	Swayzee	Grant.
Catterlin, Julia M	1903	Frankfort	Clinton.
Chambers, Roy O	1898	Lewis	Vigo.
Chesnut, Bertha H	1904	Odon	Daviess.
Chrismer, Hattie E	1902	Montpelier	Blackford.
Clampitt, Charles D	1903	Clarksville	Tippecanoe.
Clampitt, Chester L	1906	Clarksville	Tippecanoe.
Clampitt, Henry J	1900	Clarksville	Tippecanoe.
Clark, Harold L	1900	Rensselaer	Jasper.
Clark, George E	1896	Attica	Fountain.

State of Indiana, Marion County, ss:

Personally appeared before me, a Notary Public in and for said State and County aforesaid, Richard O. Johnson, Superintendent of the Indiana Institution for the Education of the Deaf and Dumb, who, being duly sworn, upon his oath says that the foregoing is a complete *itemized inventory of all the property, real and personal, belonging to the said institution or to the State of Indiana and connected therewith, or in use in or about the same on the 31st day of October, 1906. There are no liabilities.

RICHARD O. JOHNSON.

Subscribed and sworn to before me this 22nd day of December, 1906.

CLARANCE A. CARLL,
Notary Public.

[Seal]

My commission expires March 22, 1910.

*The itemized inventory, of which the foregoing is a recapitulation, is on file in the office of the Institution.

BIENNIAL REPORT

OF THE

TRUSTEES OF INDIANA UNIVERSITY

FOR THE

FISCAL YEARS ENDING OCTOBER 31, 1905
AND OCTOBER 31, 1906

To the Governor

INDIANAPOLIS
WM. E. BURFORD, CONTRACTOR FOR STATE PRINTING AND BINDING
1907

THE STATE OF INDIANA, }
EXECUTIVE DEPARTMENT, }
January 14, 1907. }

Received by the Governor, examined and referred to the Auditor of State for verification of the financial statement.

OFFICE OF AUDITOR OF STATE, }
INDIANAPOLIS, April 16, 1907. }

The within report, so far as the same relates to moneys drawn from the State Treasury, has been examined and found correct.

J. C. BILLHEIMER,
Auditor of State.

APRIL 16, 1907.

Returned by the Auditor of State, with above certificate, and transmitted to Secretary of State for publication, upon the order of the Board of Commissioners of Public Printing and Binding.

FRED L. GEMMER,
Secretary to the Governor.

Filed in the office of the Secretary of State of the State of Indiana, April, 16, 1907.

FRED A. SIMS,
Secretary of State.

Received the within report and delivered to the printer April 18, 1907.

HARRY SLOUGH,
Clerk Printing Bureau.

REPORT OF THE INDIANA UNIVERSITY

BLOOMINGTON, IND., January 9, 1907.

To the HONORABLE J. FRANK HANLY, Governor of Indiana:

Dear Sir—I have the honor to transmit to you the biennial report of the Board of Trustees of Indiana University for the fiscal years ending October 31, 1905, and October 31, 1906.

I. A BRIEF HISTORY AND DESCRIPTION OF THE UNIVERSITY

By virtue of the State Constitutions of 1816 and 1851, and the Acts of the General Assembly thereunder, the Indiana University is the State University of Indiana and is the head of the public school system of the State. The institution was founded by an Act of the Legislature, approved January 20th, 1820, establishing "the State Seminary" at Bloomington and appropriating to its use certain lands granted by Congress to the State for that purpose. Its doors were opened for the reception of students in 1824. By an Act of January 24, 1828, its name was changed to that of the "Indiana College;" and by an Act of February 15, 1838, to "the Indiana University." After the adoption of the present Constitution in 1851, the Legislature passed a bill (approved June 17, 1852) enacting that "the institution established by 'an Act to establish a college in the State of Indiana,' approved January 28, 1828, is hereby recognized as the University of the State." On June 24, 1902, the Supreme Court of Indiana, in the case of *Fisher v. Brower*, rendered a decision, without a dissenting opinion, that "the Indiana University is an integral part of our free school system;" "that it was the special creation of the constitution;" and that "the University, as well as its endowment, has always been under the supervision of the State."

The first graduating exercises were held in 1830. The University was made co-educational in 1868. The School of Law was established in 1842, and the School of Medicine in 1903.

3. NEEDS OF THE INSTITUTION

I beg to submit the following statement of our most urgent and immediate necessities.

HEATING AND LIGHTING PLANTS

Two years ago the condition of our heating and lighting plant was reported to the Legislative Committee as follows:

"It is not necessary to repeat from past reports the history of the old plant. The situation of two years ago [1902] plainly demanded an adequate modern plant with every appliance for economy of coal and service. We were given \$20,000. It was extremely difficult to know how to make a wise use of such a sum. The problem was to do something to meet the immediate necessities, and at the same time waste nothing on temporary appliances. After long consideration and consultation with the Governor, we decided to have plans and specifications made for a complete plant, and then to build as much of that plant as we could afford.

"We have accordingly a new building, one boiler, one engine and generator, with space and with plans for a completed plant.

"Meanwhile we must run the old plant and the one boiler in the new plant together. We have no mechanical stokers. We must have extra service for the two plants."

Since that time two new conditions have arisen:

1. The boiler capacity of the old and new plants combined is not sufficient when the new buildings are added.
2. The old steam mains have given out in various places.

We have been obliged to put down a temporary high pressure main to supply the Student Building, because we could not afford to buy the larger, but, in the long run, the more economical low pressure main. We are in urgent and immediate need of an entire new system of mains, properly laid in tunnels where they will be accessible.

THE EQUIPMENT OF THE NEW LIBRARY

I submit plans and estimates for the equipment of the New Library. An appropriation for the purpose is of equal importance with that for the heating and lighting system, and the appropriation therefor should be made immediately available.

Stacks—The University has at present 58,941 volumes on its accession book, 859 volumes bought and not “accessioned,” 3,000 volumes of bound duplicates, and 6,000 pamphlets. To house this material will require all of two stack stories, and to provide for eight years of growth at the present rate will require another story. The plan of our stack house, with the main floor on the level of the third stack story, necessitates the installation of three stories to make the stacks usable. The plan finds its justification in the fact that by its employment the books are at once close to the seminar rooms in the basement, and to the delivery desk on the main floor.

ADDITION TO LIBRARY AND ADMINISTRATION BUILDING

Two years ago we were granted an appropriation of \$100,000 for a library and administration building. It was impossible, for that sum, to erect a building which would provide for these purposes at the present time, without consideration of the future. It was therefore vitally important that the building should be so constructed that it could be easily enlarged when the Legislature should see fit to provide for the same. Accordingly, after consultation with

the Governor, plans were made for a building which could be built for \$100,000, and which could be added to in a natural and convenient manner. The architect of the building has designed the proposed addition. We are in great and immediate need of this addition, especially for the use of the administrative offices. Our present office space is entirely inadequate. The offices are used by the entire body of students and faculty more than any other department of the University. We have a vast quantity of public record but no fire proof vaults. We very earnestly urge that this pressing need of the University shall be met.

ADDITION TO MAXWELL HALL

Maxwell Hall, now used as a library, is to be used for the Law School. Unfortunately the building does not provide enough space for the law classes even with the present enrollment. We have, therefore, planned an addition which can be made in a convenient manner. The plan is submitted.

CHEMISTRY BUILDING

The science departments in Owen and Wylie Halls are all over-crowded. Students are every term turned away from some of these departments for lack of space. We are of the opinion that the best mode of immediate relief would be the erection of a separate building for the department of Chemistry. It is particularly desirable that this department should have a separate building, because of the gases, which are offensive and injurious to apparatus in other departments. The plan is submitted.

ADDITION TO STUDENT BUILDING

The Student Building is the gift of about two thousand alumni, students, and other friends of Indiana University. The building contains the following accommodations: Rooms for social and religious purposes for women; Women's Gymnasium; lecture room (50x80, capacity 600 seats) for smaller assemblies, lectures, etc.; rooms for social and religious purposes for men; offices for various student or-

ganizations, etc. The building should be completed by the addition of an East wing (140x80, corresponding to the West wing already built) which can be used as a Men's Gymnasium, and also in the absence of a University Auditorium as a hall for larger University assemblies. The plan is submitted.

LAND

The University has not received an appropriation to purchase any part of the present campus. In consequence, the Trustees have been obliged to purchase small additions at prices which increase as the city extends about the campus. We have repeatedly urged that an appropriation be made to buy land which is adjacent to the campus and which is not yet built upon by private parties. We urge this again in the hope that the purchase may be made before we are hemmed in on every side.

Respectfully submitted,

BENJAMIN F. SHIVELY,

President of the Board of Trustees.

TREASURER'S REPORTS

REPORT FOR YEAR ENDING OCTOBER 31, 1905.

To the Honorable Board of Trustees of Indiana University:

Gentlemen—The Treasurer of Indiana University presents the following as his report for the year ending October 31, 1905:

RECEIPTS FROM THE STATE

Educational levy	\$152,222 32
Interest on endowment	32,620 34
Interest on University bonds	7,200 00

FIFTY-EIGHTH ANNUAL REPORT

OF THE

Board of Trustees and Superintendent

OF THE

CENTRAL INDIANA HOSPITAL
FOR INSANE.

At Indianapolis, Ind.

For the Fiscal Year Ending October 31, 1906.

TO THE GOVERNOR

INDIANAPOLIS:

WM. B. BURFORD, CONTRACTOR FOR STATE PRINTING AND BINDING
1906

THE STATE OF INDIANA,
EXECUTIVE DEPARTMENT,
January 12, 1907. }

Received by the Governor, examined and referred to the Auditor of State for verification of the financial statement.

OFFICE OF AUDITOR OF STATE,
INDIANAPOLIS, January 15, 1907. }

The within report, so far as the same relates to moneys drawn from the State Treasury, has been examined and found correct.

J. C. BILLHEIMER,
Auditor of State.

January 15, 1907.

Returned by the Auditor of State, with above certificate, and transmitted to Secretary of State for publication, upon the order of the Board of Commissioners of Public Printing and Binding.

FRED L. GEMMER,
Secretary to the Governor.

Filed in the office of the Secretary of State of the State of Indiana, January 15, 1907.

FRED A. SIMS,
Secretary of State.

Received the within report and delivered to the printer January 15, 1907.

HARRY SLOUGH,
Clerk Printing Bureau.

REPORT OF THE BOARD OF TRUSTEES.

HON. J. FRANK HANLY, *Governor of Indiana*:

Sir—We, the undersigned Trustees of the Central Indiana Hospital for the Insane, hereby submit our report for the year ending October 31, 1906. We also present herewith the report made to us by the Superintendent of the Institution, in which will be found a detailed statement of all matters relating to the management during the past year. The Superintendent has also set forth in his report his recommendations concerning the needs of the Institution for the coming year. We wish to emphasize our endorsement of his recommendations and we hope they will also meet with your approval.

PROPERTY.

An appraisement of the real estate and personal property belonging to the institution shows a slight increase over that of a year ago, the increase being in the personal property. The said appraisement is as follows:

Real estate.....	\$1,634,250 00
Personal property.....	377,999 70
Total	\$2,012,249 70

PATIENTS.

The number of patients who have received treatment at the institution during the past three years is as follows:

	1904.	1905.	1906.
Total number at beginning of year.....	1,946	1,982	2,070
Number received during year.....	637	553	441
Number discharged during year.....	404	271	373
Number died during year.....	197	194	162
Total number treated during year.....	2,583	2,535	2,702
Number on rolls at close of year.....	1,982	2,070	1,976
Average daily number actually present..	1,787.64	1,832.97	1,858.88

The same crowded condition commented upon in our reports for a number of years past still continues. The number of patients during the past year, as in several years past, is far beyond the normal capacity of the institution, and will continue so until the completion of the new hospital now under course of erection at Madison, Indiana. On account of its present crowded condition, the Superintendent has been compelled to refuse many applications for admission to the institution during the year, and several hundred insane patients are now confined within the local poor asylums in the various counties throughout the district.

APPROPRIATIONS AND EXPENDITURES.

The various funds for which appropriations were made for the support of the institution during the past year were maintenance, repairs and clothing, together with certain special appropriations, the amount of each and the expenditures therefrom being as follows:

Regular.

Maintenance (regular).....	\$300,000 00
With \$160 extra for each person actually present over a daily average number of 1,788 inmates each month, which, upon the basis of the daily average present for the past year, made the additional sum of.....	11,321 94
Total	\$311,321 94
Amount expended therefrom.....	297,909 11
Balance unexpended.....	\$13,412 83
Repairs	\$25,000 00
Amount expended therefrom.....	24,965 07
Balance unexpended.....	\$34 93
Clothing	\$14,000 00
Amount expended therefrom.....	13,951 71
Balance unexpended.....	\$48 29

Special.

Painting	\$5,000 00
Amount expended.....	4,987 60
Balance unexpended.....	\$42 40

Electrical equipment.....	\$2,500 00
(No part of this appropriation was expended.)	
Laundry equipment.....	\$2,500 00
Amount expended.....	2,448 30
Balance unexpended.....	\$51 70
Cement work.....	\$1,500 00
Amount expended.....	1,500 00

By operation of law all of the unexpended balances of the appropriations above named have reverted to the general fund in the State Treasury.

We call your attention to the fact that no part of the \$5,000 appropriated for electrical equipment was used and all reverted to the general fund. This was due to the fact that when the work necessary to be done in this department was mapped out and the cost estimated, the appropriation was found to be wholly inadequate to make the necessary improvements. It was thought best not to begin the purchase of new equipment until an appropriation had been procured, sufficient to do the work needed. The needs of the institution in this regard are discussed in another part of this report.

SALE OF WASTE MATERIAL.

The amount of waste and discarded material sold from the institution during the past year amounted to \$2,185.01, which money was paid into the State Treasury.

MAINTENANCE PER CAPITA.

The per capita cost of maintenance at the institution for the past year, based upon the daily average number of patients actually present was \$160.25. In estimating the per capita cost of maintenance, those patients who were temporarily absent from the institution upon furlough are not considered; but the fact that certain patients are thus absent does not mean that the institution is free from all expense in connection with them, because it is necessary for the officers of the hospital to keep in constant communication with them in order that they may know their condition.

Of course if we should estimate the per capita cost on the basis of the total daily average number of patients enrolled, it would be materially reduced.

COMFORT OF PATIENTS.

Although the institution has been crowded beyond its normal capacity, yet the patients have been provided for and maintained in a comfortable manner. They have been given excellent food in ample quantities, and their clothing has been clean and good. While the sleeping apartments have been necessarily crowded, yet the management has been such as to care for all in a comfortable way.

GENERAL CONDITION.

The general condition of the hospital during the past year has been kept up to the high standard heretofore maintained by the Superintendent, and the general work of making new improvements and of making repairs in the various departments and about the grounds has been continued. Excellent discipline has been maintained throughout the institution and all departments are working in perfect harmony. This is evidenced by the fact that no mishaps or accidents worthy of mention have occurred during the year.

NEEDS OF THE INSTITUTION.

Electrical Equipment.—The last General Assembly made an appropriation of \$5,000 with which to purchase and install new electrical apparatus at the institution. During the past year, when we attempted to make these improvements, it was found that the appropriation was wholly inadequate to meet the demands in this department; the above amount not being sufficient to cover more than one-half the necessary cost. After considering the matter, it was deemed best not to attempt to make these improvements in the electrical department until they could be made in an adequate manner. To begin the work and not be able to complete all that was needed, would necessitate making extra expenditures when an attempt was made to complete

these improvements a year hence. It was therefore decided to allow all of the appropriation to revert to the general fund in the State Treasury and to ask the next General Assembly for an appropriation of \$10,000, which sum we deem necessary to make the improvements needed.

The old electrical apparatus at the institution was installed about the year 1890, and since that time the demands upon it have become so great that an equipment of at least one-fourth additional capacity is now needed. A new dynamo should be purchased of sufficient power to supply all of the needs of the institution in this department. The new equipment should be of such capacity and so complete that the old apparatus now in use can be kept in reserve for temporary and emergency purposes only, to be used in case of accident or during the making of necessary repairs upon the new apparatus.

PAINTING.

An appropriation of \$10,000 should be made by the General Assembly for painting. The buildings of the institution have become so vast and the need of painting so urgent, that it is necessary that this amount should be appropriated to meet the demands in that regard.

PLUMBING.

As to the plumbing in the institution, it is necessary that there be a constant expenditure, not only in the repair of the old plumbing, but in making new additions thereto, and to meet the demands for this purpose an appropriation of \$5,000 is necessary.

FIRE PROTECTION.

We find it necessary to ask for an appropriation of \$5,000 for additional fire protection at the institution. We desire to install during the coming year a stationary chemical fire extinguishing apparatus in the basement of the department for men. The apparatus contemplated consists of large tanks filled with fire extinguishing chemicals, to be

located in the basement of the building with standpipes running to each ward, where fire hose are attached. In case of fire starting in any one of the wards, the attendant in charge of such ward can immediately turn on the fire pressure from these tanks and be prepared to extinguish the fire before it has an opportunity to spread.

When we consider the great number of helpless beings confined within the institution and the awful calamity that might result from fire, it would seem to be wholly unnecessary to enter into any argument as to the need of establishing this fire extinguishing apparatus in the institution. The small expenditure needed to accomplish this purpose might result in saving the State several hundred thousand dollars in property, aside from the protection furnished to the lives of human beings.

CEMENT WORK.

An appropriation of \$2,500 is necessary to continue the work of building cement walks and the construction of cement work in the various departments. The construction of this cement work adds not only to the beauty of the grounds and buildings, but also to the general comfort of the patients and attendants and to the general sanitary condition of the hospital.

The regular appropriations for the coming two years should be as follows:

REGULAR APPROPRIATIONS.

Maintenance (regular) with \$160 extra for each person actually present over a daily average number of 1,800 inmates each month	\$310,000
Repairs	25,000
Clothing	15,000

It is not necessary to present any argument as to the need of these regular appropriations. The experience of the past two years has shown their necessity.

Your personal knowledge of the general work of this Board and the close attention given by you to many of the details connected with the management of the institution,

causes us to feel that you will agree with us as to the necessity for these appropriations.

We can not close this report without again complimenting Superintendent George F. Edenharter for the excellent service rendered by him during the past year as well as in the preceding years of his management of the institution.

We earnestly invite you and all other persons interested in hospital management to visit the institution. We especially invite a visit from the members of the coming General Assembly, so that they may judge for themselves as to the excellent work done and as to the future needs of the institution.

Respectfully submitted,

D. H. DAVIS,
GEO. B. LOCKWOOD,
ELI MARVIN,

Board of Trustees.

Indianapolis, October 31, 1906.

REPORT OF THE SUPERINTENDENT.

To the Honorable Board of Trustees:

Gentlemen—In submitting to you my report for the fiscal year 1905-1906, I insert, as an introduction to the same, and for your convenience, the following abstract of the statistical tables:

At the beginning of the fiscal year there were 2,070 patients—912 men and 1,158 women—enrolled on the records. At the close of the year we had remaining 1,976 patients—877 men and 1,099 women—a decrease of 94 from the preceding year. This decrease was caused by rejecting all cases which on the face of the commitment papers showed a chronic nature and harmless disposition. We were compelled to reduce the number of our patients, as the overcrowded condition demanded it.

Four hundred and forty-one patients—262 men and 179 women—were admitted during the year; 373 patients—197 men and 176 women—were discharged; and 162 patients—100 men and 62 women—died. Of the 441 patients admitted, 81 were recommitments.

The tables show that of these admissions, one was over 80 years of age, 15 were from 70 to 80 years, 25 from 60 to 70, 72 from 50 to 60 years of age, or, in other words, 113 patients were admitted whose age was over 50 years.

The tables further show that 46 patients died which have been in the institution for over five years.

Two thousand seven hundred and two patients were under treatment during the year—1,174 men and 1,528 women; the daily average number of patients actually present (not counting those absent on furlough) during the year was 847.038 men and 1,011.848 women; total, 1,858.886 patients.

The percentage of recoveries to the total number of patients under treatment is 7.846; the percentage of recoveries

to the number admitted during the year is 48.072. The percentage of deaths is 5.958.

We have in this report, at the request of the National Conference of Charities and Corrections, inserted an additional table.

APPROPRIATIONS.

I recommend to your board that you ask the following appropriations for the fiscal years of 1907-08 and 1908-09:

MAINTENANCE.

The sum of three hundred and ten thousand dollars and at the rate of one hundred and sixty dollars per capita per annum for each person actually present over a daily average number of 1,800 inmates each month for each fiscal year 1907-08 and 1908-09.

Repair—Twenty-five thousand dollars for each fiscal year 1907-08 and 1908-09.

Clothing—Fifteen thousand dollars for each fiscal year 1907-08 and 1908-09.

SPECIFIC.

Painting—Ten thousand dollars.

Plumbing—Five thousand dollars.

Cement Work—Twenty-five hundred dollars.

Fire Protection—Five thousand dollars.

Electric Equipment—Ten thousand dollars.

ESCAPES.

In the past fiscal year 18 patients escaped from the institution; 16 were returned.

CASUALTIES.

Two patients committed suicide during the year.

FIRE.

On February the 13th fire was discovered in the basement at the Department for Men. Owing to the fact that a number of men were investigating the cause of trouble present

in the electric wire system, it was quickly controlled. The damage to the building was slight; the cable wires, however, had to be renewed.

PATHOLOGICAL DEPARTMENT.

The work in this department was continued along the same lines as last year.

The lectures for the fiscal year 1906-07 are arranged as follows:

The Medical College of Indiana (the medical department of Purdue University) will present a course of lectures for 1906, Professor E. G. Reyer, M. D., and Professor A. E. Sterne, M. D. (alternating), representing the college, their lectures designated by "B." In connection therewith Charles F. Neu, M. D., the Pathologist of the institution, will deliver a course in Neuro-Pathology, designated by "A."

1906.

September 11th, 2 p. m.—

- A. The evolution of the nervous system.
- B. General considerations and definitions.
Classification of insanity.

Cases illustrating: Hallucinations, delusions, mental inco-ordination, exaltation, depression, apathy, the stigmata of degeneration, etc.
Professor Reyer.

September 18th, 2 p. m.—

- A. The developmeent of the nervous system.
- B. Melancholia and hypochondriasis.

Cases illustrating: Simple, agitated, stuporous melancholia, hypochondriasis, etc.
Professor Sterne.

September 25th, 2 p. m.—

- A. The surface anatomy of the brain and its relations to the external surface of the skull.
- B. Mania.

Cases illustrating: Simple, acute, subacute and chronic mania.

Professor Reyer.

October 2d, 2 p. m.—

- A. The internal anatomy of the brain.
- B. Acute confusional insanity.
Stuporous insanity.

Cases illustrating same.

Professor Sterne.

October 9th, 2 p. m.—

A. The anatomy and physiology of the spinal cord.

B. Periodical and circular insanity.

Insanity associated with physiological periods.

Cases illustrating: Recurrent forms, adolescent, climacteric, senile forms, etc. Professor Reyer.

October 16th, 2 p. m.—

A. The blood and lymph circulation of the nervous system.

B. Paranoia.

Cases illustrating: Paranoia and pseudo-paranoia.

Professor Sterne.

October 23d, 2 p. m.—

A. The pathological conditions involving the gray matter of the cord and their clinical significance.

B. Insanities associated with the neuroses.

Cases illustrating: Epileptic, hysteric, chronic, neuropsychic forms, etc. Professor Reyer.

October 30th, 2 p. m.—

A. The pathological conditions involving the white matter of the cord and their clinical significance.

B. Dementia parietica.

Cases illustrating same, and delusions of chronic mania.

Professor Sterne.

November 6th, 2 p. m.—

A. The connections of the spinal cord and the various parts of the brain.

B. Insanities associated with coarse lesions of central nervous system.

Cases illustrating: Cerebral hemorrhage, the scleroses, tumors, injuries, etc. Professor Reyer.

November 13th, 2 p. m.—

A. Pathological conditions involving some of the more prominent bundles of fibers connecting different parts of the brain, and their clinical significance.

B. Insanities associated with inorganic and organic intoxications.

Cases illustrating: Alcohol and drug habits, post febrile cases, etc.

Professor Sterne.

November 20th, 2 p. m.

Terminal dementia.

Idiocy and imbecility.

Professor Reyer.

November 27th, 2 p.m.

Miscellaneous subjects—Clinical.

December 4th, 2 p. m.

Miscellaneous subjects—Clinical.

December 11th, 2 p. m.

Miscellaneous subjects—Clinical.

The State College of Physicians and Surgeons (in affiliation with Indiana University) will present the following course of lectures for 1907, Professor Hutchins and Professor Todd representing the college, their lectures designated by "B." In connection therewith the Pathologist of the institution will deliver a course in neuropathology, designated by "A."

1907.

January 4th, 2 p. m.

- A. The evolution of the nervous system.
- B. States of mental depression, melancholia. Professor Todd.

January 11th, 2 p. m.

- A. The development of the nervous system.
- B. States of mental exaltation, mania. Professor Todd.

January 18th, 2 p. m.

- A. The surface anatomy of the brain and its relations to the external surface of the skull.
- B. States of mental stupor and enfeeblement. Professor Todd.

January 25th, 2 p. m.—

- A. The internal anatomy of the brain.
- B. Intoxication insanities, alcohol, opium, cocaine, rarer forms. Professor Todd.

February 1st, 2 p. m.—

- A. The anatomy and physiology of the spinal cord.
- B. Insanities following bacterial and toxalbumic poisoning; puerperal delirium, febril psychoses, periodic insanities, mania, circular insanity, adolescence. Professor Todd.

February 8th, 2 p. m.—

- A. The blood and lymph circulation of the nervous system.
- B. Insanities following autogenic poisoning, uraemia, diabetes, myxoedema, auto-intoxication, etc. Professor Todd.

February 15th, 2 p. m.—

- A. The pathological conditions involving the gray matter of the cord and their clinical significance.
- B. Insanities due to organic lesions, paretic dementia, specific infections. Professor Hutchins.

March 1st, 2 p. m.—

- A. The pathological conditions involving the white matter of the cord and their clinical significance.
- B. Insanities due to organic lesions, continued. Professor Hutchins.

March 8th, 2 p. m.—

- A. The connections of the spinal cord and the various parts of the brain.
- B. Senile and organic dementia. Professor Hutchins.

March 15th, 2 p. m.—

- A. Pathological conditions involving some of the more prominent bundles of fibers connecting different parts of the brain and their clinical significance.
- B. Psychological degeneracy, paranoia. Professor Hutchins.

March 22d, 2 p. m.—

- A.
- B. Psychoses due to constitution neuroses. Professor Hutchins.

March 29th, 2 p. m.—

- A.
- B. States of arrested developments, idiocy, cretinism, imbecility. Professor Hutchins.

A COURSE IN MENTAL PATHOLOGY.

Special clinics are provided for those who desire to take instruction in Mental Pathology. This course will be in charge of Professor E. H. Lindley of Indiana University.

These clinics are designed to demonstrate those phenomena of insanity which are especially instructive to students of psychology.

The course this year will include the following:

1. The form of insanity:
Melancholia, mania, dementia, idiocy, imbecility, dementia parva, impulsive and compulsive insanity; paranoia, dementia puerilis and senile dementia.
2. Psycho-pathology:
 - a. Disturbances of perception (illusions, pseudo-hallucinations and hallucinations).
 - b. Disturbances of mental elaboration (amnesia, paramnesia, loss of orientation, malformation of ideas and concepts, disturbances of judgment and reasoning, disturbances of self-consciousness, retardation and flight of ideas, etc.).
 - c. Disturbances of the emotions (anhedonia, delusions, sporadic and systematized).
 - d. Disturbances of volition and action (impulsive and compulsive ideas, echo-praxis, negativism, stereotypism, abulia, etc.).

Cases illustrative of the above will be presented to the classes.

Members of the hospital staff will alternate in arranging cases for all of the clinical lectures.

The following general rules govern the course of both colleges:

All students must be in their seats promptly at the hour scheduled.

Questions will be furnished by the Pathological Department in the final examinations.

Due notice of autopsies will be given the classes by telephone to college.

Certificates of attendance will be issued by the colleges for these lectures.

Students must maintain quiet while in the grounds or buildings.

Smoking in the department is prohibited.

These lectures are free to all practitioners and students of medicine. Others will not be admitted except upon special permission by the Superintendent or Lecturer.

The report of the Pathologist will, this year, be found following the report of the Superintendent. A synopsis of his report shows that—

1. Forty-two autopsies were held.
2. Twenty-two lectures were given—eleven didactic and eleven clinical.
3. Ten lectures upon neuro-pathology with pathological demonstrations.
4. One hundred and thirty-one staff meetings at which one hundred and fifty cases were presented for examination.
5. Eighty-nine cases taken before the college classes for clinical demonstration.
6. Thirty-two gross pathological specimens preserved for the museum.

MEDICAL STAFF.

This remains as last year.

The Pathologist, Dr. Chas. F. Neu, resigned his position on October 31, 1906, having served in this capacity since October 1, 1903.

He leaves the service with the best wishes of all and a hearty appreciation of his work.

IMPROVEMENTS AND REPAIRS.

Under this heading we only mention a few of the more important items.

Dormitory—The large dormitory at the Department for Men was changed into sleeping rooms for employes.

New Floors—Ten of the wards at the Department for Men were supplied with entire new floors.

Electric Cable—Owing to the fire the electric cables at the Department for Men had to be replaced.

Electric Conduits—All cables to both of the main departments were placed in vitrified tile conduits.

Commutators—All machines in the power-house were refitted with new commutators.

Painting—A number of the wards at both departments were repainted.

Cement Walks—A new floor was laid in our boiler house.

New walks were put in leading from the Women's Department to the main walk.

Also new walks around the new hospital.

Plastering—An immense amount of patchwork was required in all of the departments.

Grading and Sodding—Following the work of previous years this was continued.

Dry Rooms—Another six cabinet all metal dry room was installed in the laundry.

Steam Heating and Plumbing—Considerable repair in both of these branches was made during the fiscal year.

EMPLOYES.

Our thanks are once more due to the officers and employes for faithful service rendered under trying circumstances during the year, and we recognize that in a large measure the progress of the institution is due to their effort.

BOARD OF TRUSTEES.

In conclusion I again acknowledge myself under obligations to the Board of Trustees for many acts of kindness, but above all for their great interest and hearty co-operation in all that pertains to the welfare of the institution and the patients therein.

Very respectfully,

GEO. F. EDENHARTER, M. D.,

Superintendent.

REPORT OF PATHOLOGIST.

George F. Edenharter, M. D., Superintendent, Central Insane Hospital for the insane:

Dear Sir—I beg to submit the following annual report from the Pathological Department for the year ending October 31, 1906:

During the year permission was obtained for and autopsy performed upon 42 bodies. A summary of the pathological, clinical and microscopical report will be found hereto appended.

Thirty-two gross specimens have been prepared and added to the collection for the museum. A list of them will also be found appended hereto.

As heretofore, examinations of blood, urine, sputa, etc., submitted by the staff physicians, have been made whenever they had not the time to do so themselves, or when a special examination was required.

The staff meetings, as outlined in my previous reports, have been continued along the same lines, viz.: Regular staff meetings were held three times weekly, every Monday, Wednesday and Friday morning, beginning at 10:30. At these meetings the members of the staff alternated in presenting one or more cases. The number of staff meetings were 131. A more or less systematic examination is made of the mental condition, and also of the physical condition, where this has not been done beforehand, or where some special physical condition is reported by the physician in charge, followed by a discussion of the case by all members of the staff.

In all one hundred and fifty cases have been presented. The results of these examinations were taken down, and have been placed on record, and can be used as a reference in the study of the future course and termination of the case presented. In the examination of these cases the main object has been to ascertain and determine the prominent and characteristic features in each individual case, and the underlying conditions that were the probable factors in bringing about the disturbance of the mental faculties. This problem is rather a difficult one. To do it properly and scientifically many factors necessarily come into consideration which are most difficult to regulate and control, and tend to render this part of our work a source of discouragement and somewhat unsatisfactory in many respects. In the first place, one should have a full report of the status of the mental and physical condition of the patient, when he or she was considered to be in a normal condition. Without this it is impossible to arrive at a correct conclusion of the degree and extent of the disturbance that has developed, consequently whatever conclusions are arrived at can only be of relative value. In the second place there should also be a full report in regard to the patient's heredity, to enable one to judge to some extent of the characters and qualities in the

make up that have probably been transmitted as a heritage. There should also be a complete report of the environment and of the early education and training. The importance and significance of the latter can be appreciated when it is taken into consideration that this is the period of life when an individual is most susceptible to the impressions that are received, those impressions being exclusively determined by the surroundings and by the judgment and will of those who have to direct and control the development at this time, as it is at this time of life that the foundation is laid upon which the whole future structure is erected. In the third place there should be a complete examination made of the patient at the time, or as soon as possible after admission, and a report made of it and of the progress of the case while in the institution. Even with all these data it is at times quite impossible to make any positive diagnosis; how much more so is it, then, when we have nothing but the report of the commitment record and the irrelevant, incoherent statements of the patients themselves, whose thoughts and ideas are tintured and modified by the colorings of their own peculiar mental or physical disturbance, or both. While the reports which have been made are far from being complete, or what they should be, yet they are certainly better than none at all, and besides they form a nucleus to which can be added as the facilities and opportunities for making fuller and more complete reports are gradually improved and utilized. As intimated in the previous report the importance of these histories is indicated not only in the clinical aspects of the case, but also in the association of the clinical condition with the pathological findings, and the placing of them upon a definite pathological basis. Too much stress can therefore not be placed upon the necessity of instituting and carrying out measures which will serve to attain that object.

Lectures, as outlined in last year's report, were delivered to the students of medicine who attended the course on clinical psychiatry. They consist of the following:

1. The evolution of the nervous system.
2. The development of the nervous system.
3. The surface anatomy of the brain and its relation to the external surfaces of the skull.
4. The internal anatomy of the brain.
5. The anatomy and physiology of the spinal cord.
6. The blood and lymph circulation of the nervous system.
7. The pathological conditions involving the gray matter of the cord and their clinical significance.
8. The pathological conditions involving the white matter of the cord and their clinical significance.
9. The connections of the spinal cord with the various parts of the brain.
10. Pathological conditions involving some of the more important bundles of fibers connecting different parts of the brain and their clinical significance.

The following papers were read before the members of the Marion County Medical Society:

1. Report of a case of rupture of the aorta and hemorrhage into the pericardium.
2. Report of two cases of brain tumor, clinical report given by Dr. J. A. MacDonald, one of the assistant physicians of the institution. The report of one of them was published in the Journal of the American Medical Association.
3. Report of a case of death by coma of about eight hours' duration, in which pulmonary and intestinal tuberculosis was found.
4. The following paper, viz.: Report of eight cases of brain tumor, with comments, was presented at the Indiana State Medical Association.

ACUTE MELANCHOLIA.

189. Age 50. First admission. Psychosis: Acute melancholia. Reported: Hypochondriacal, suicidal, sleepless, nervous, at times excitable, claiming that he was losing his mind.

Duration of psychosis: About one year.

Cause of death: Asphyxia by hanging.

Clinical report: Admitted September, 1905. Age, 50. Occupation, farmer, with a psychosis of acute melancholia, onset about one year prior to admission. Physical condition at time of and for two years previously had been very poor, mostly dependent upon gastro-intestinal disturbances. The mental condition during this time was one of hypochondria, feeling that he would never get better, that as a consequence he could not provide for family, and that he would come to want and suffering. This induced thoughts of their and his own destruction to prevent such a condition of affairs from coming to pass, feeling that in destroying them he would assure their happiness and they would go to heaven, even though it meant the loss of his own soul and happiness. This he carried out by striking them on the head when asleep, pouring kerosene over the bed and floor, setting fire to it and trying to commit suicide by remaining in the burning building, but failed in the latter attempt. After admission he improved considerably

physically and mentally, stated that he lost all thought of self-destruction, was exemplary in his actions and conduct for over two months, but suddenly hung himself one morning when permitted to go into the bathroom unwatched.

Pathological report: Band of constriction about the neck, cyanosis of the neck and head, slight general arteriosclerosis, fatty infiltration of the right heart, slight cardiac hypertrophy, chronic bilateral pleuritic adhesions, slight lobular pulmonary emphysema, and basal congestion, venous engorgement of the abdominal viscera, diffuse patchy ecchymosis of the stomach and intestines, chronic diffuse nephritis, extensive dural adhesions, slight chronic external hydrocephalus, chronic meningitis, cystic choroid plexus.

Microscopical report: Nerve cells stain diffusely by Nissl's stain, with H and E, the blood vessels are seen to be moderately filled and the perivascular spaces are prominent. In the thyroid glands there is some irregularity in sizes of the vesicles, and the smaller ones more or less infiltrated with epithelial cells. In the heart there is fatty infiltration of the walls of the ventricle, diffuse staining of the muscle fibres with eosin. In the lungs engorgement of the alveolar capillaries and larger blood vessels. In the arteries a moderate degree of endarteritis. In the choroid plexus numerous small concentric bodies, varying in intensity in staining. In the pineal glands epithelioid cells arranged more or less into alveolar formation with numerous circular and irregular oval bodies staining homogeneously. In the stomach and intestines intense engorgement and proliferation of the superficial epithelium. In the spleen diffuse engorgement, rather small size of the malpighian bodies. In the kidneys intense engorgement, diffuse increase of intertubular fibrous tissue, in some places more or less strandlike, extending from the capsule inward, somewhat cone-shaped; in many tubules the epithelium is shallow and lumen contains some disquamated cells. In some of the glomeruli Bowman's capsule is thickened and nuclei are increased. In the liver intense engorgement, hepatic cells in the centre of the lobule contains considerable brownish yellow pigment, foci of small round cell accumulation and slight increase of connective tissue in some of the portal fissures.

183. Male. Age 50. First admission. Psychosis: Chronic melancholia. Reported confused, despondent, melancholic, irritable, profane, imagined persons were watching him.

Duration of psychosis: Two years.

Cause of death: Croupous pneumonia.

Clinical report: Admitted February, 1905, with a psychosis of three months' duration. After admission the course was a progressively developing dementia. Physically on admission his general health was good, but he complained some of kidney trouble. There was a gradual loss in body weight. On November 25th, 1905, he was taken ill with a high temperature, rapid pulse and rapid breathing and died the following day.

Pathological report: Pneumonic consolidation of the lower lobe of the right lung, hypostasis of the posterior portion of the lower lobe of the left lung, localized chronic pleuritic adhesions on the right side, congestion of the bronchial and trachial mucosa, hyperplasia and pigmentation of the bronchial glands, persistent thymus gland, slight cardiac hypertrophy, distension of the right auricle, sclerosis of the mitral valves, sclerosis and calcareous infiltration of the aortic valves, and narrowing of the aortic orifice, heart muscle rather soft, moderate arteriosclerosis, transverse colon U-shaped and reaching the pelvic brim, chronic gastritis, chronic nephritis, moderate hyperplasia of the spleen, chronic meningo-encephalitis, general cerebral atrophy, slight increase of subdural and subarachnoidean fluids, extensive sclerosis of the frontal lobes, dilatation of the ventricles, systic choroid plexus, general jaundice.

Microscopical report: Extensive chromatolysis. Heart: Extensive diffuse fibrous tissue increase running between the individual fibres and groups of muscle fibres. Arteries: Extensive diffuse endarteritis thickening and beginning degeneration of the deeper portion. Lung: Intense engorgement of the alveolar capillaries with rupture of some, vesicles in all stages of beginning consolidation from filling with serous exudate plus a few leucocytes and epithelial cells to that of filling with round and a few epithelial cells. Trachea: Bronchus and oesophagus intensely engorged, bronchial glands-hyperplasia of lymph follicles, engorgement and pigmentation. Pancreas: Moderate diffuse fibrous tissue increase. Adrenals: Engorgement. Spleen: Intense engorgement, diffuse extensive increase of stroma, malpighian bodies small and few in number. Liver: Intense engorgement, dilatation extensive of the intercellular spaces, liver cell small, those in center of lobule deeply pigmented, slight increase of fibrous tissue, with a few foci of round cells in the portal fissure. Kidneys: Extensive diffuse increase of fibrous tissue, most marked in the medulla and in and about the glomeruli, Bowman's capsule thickened, many glomeruli whorl-like, tubular epithelium more or less granular, in some places completely filling the lumen, in others shallow, intense engorgement.

188. Male. Age 58. Second admission. Psychosis: Chronic mania, Reported as profoundly melancholic.

Duration of psychosis: About six years.

Cause of death: Rupture of the aorta and haemopericardium.

Clinical report: Admitted September, 1901, with a psychosis of melancholia. Had been in the hospital the preceding year. Underwent no marked change while in hospital. Physically his health prior to and at time of admission was fairly good. After admission he complained occasionally of heart trouble. January 2, 1906, and January 7, 1906, he had several attacks of pain which were considered that of angina pectoris, but only lasted temporarily. On the day of death he had been moving about the

ward as usual, had gone to the dining-room and when sitting down at the table was seen to slide off the chair to the floor, and died in a few minutes.

Pathological report: Pericardium full of blood, mostly coagulated.

Enormous hypertrophy of the heart, sclerosis of the mitral and aortic valves, diffuse aneurismal dilatation of the ascending and arch of the aorta, extensive arteriosclerosis and atheromatosis, rupture of the aorta beginning at the left coronary orifice extending along the left coronary artery and along the aorta, chronic pleuritic adhesions of the right pleura, marginal pulmonary emphysema, cirrhosis of the liver, cirrhosis of the pancreas, extensive chronic nephritis, cyst of the right kidney, hypertrophy of the prostate, hyperplasia of the bronchial and mesenteric glands, extensive pachy and leptomeningitis, excess of subdural fluid, slight dialation of the lateral ventricles, cystic choroid plexus.

Microscopical report: Nerve tissue: Moderate degree of chroma-
tolysis. Central canal of the spinal cord in the cervical region filled with proliferated epithelial cells and the central gelatinous substance extensively infiltrated with them. In the lumbar region the canal is crescent shaped, forming about three-quarters of a circle, and is filled with cells; the space enclosed is made up of tissue similar to and directly continuous with that of the central gelatinous substance. Choroid plexus: Walls of the blood vessels thickened, numerous concentric hyaline bodies. Heart: Fibroid thickening of the pericardium, interstitial fibrous tissue increase. Arteries: Extensive endarteritic proliferation of the intima, fibroid thickening of the media and more or less atheromatous degeneration of the intima. Lungs: Fibroid thickening of the pleura, thickening of the walls of the blood vessels, perivascular blackish pigmentation, engorgement of the alveolar capillaries, thickening of some of the alveolar walls and localized areas of fibrous tissue increase. Bronchial glands: Intense engorgement, diffuse blackish pigmentary infiltration, hyperplasia of the cells of the lymph follicles. Thyroid gland: Irregularity in the size of the vesicles, many more or less dilated, some of which show more or less cellular infiltration of the smaller vesicles. Stomach, intestines and appendix: Considerable hyperplasia of the lymph follicles throughout. Adrenal: Intense engorgement, foci of round cells scattered throughout the medulla. Spleen: Intense engorgement, malpighian bodies small, more or less diffuse increase of lymph corpuscles. Liver: Intense engorgement, fibroid thickening of the capsule, well marked increase of fibrous tissue in the subcapsular lobules, increase of perivascular fibrous tissue with more or less round cell accumulation in many of the portal fissures, liver cells in the center of lobules small, atrophic and deeply pigmented. Kidneys: Intense engorgement, extensive diffuse increase of fibrous tissue and round cell infiltration capsule thickened, tubules dilated, epithelium shallow, many dilated into cyst-like spaces, periglomerular tissue increase, many more or less whorl-like, walls of the blood vessels thickened.

AGITATED MELANCHOLIA.

218. Female. Age 46. First admission. Psychosis: Agitated melancholia. Reported depressed, moaning, wringing her hands, agitated, imagined the Lord was against her, that she had committed a great sin, that God tells her that she must take her own life, attempted suicide.

Duration of psychosis: About twenty months.

Cause of death: Asphyxia by hanging.

Clinical report: Admitted January, 1906, with a psychosis of agitated melancholia, beginning about one year before admission. The mental condition prior to the onset was good. The patient was well educated. Visual disturbances beginning many years ago had rendered her almost wholly blind, otherwise the physical condition to and at time of admission was good. After admission there were occasional complaints of dizziness, insomnia, palpitation of the heart and constipation. The patient was always sad and dejected, generally seclusive, apprehensive; believed everybody was against her, feared punishment for her misdeeds, was hypochondriacal, was suicidally inclined, had some insight into her condition, stating that she was going helplessly insane. The eyegrounds showed extensive retinitis pigmentosa.

Pathological report: Bands of constriction encircling the neck, moderate arteriosclerosis, chronic pleuritic adhesions on the right side, chronic nephritis, multiple uterine fibroids, cystic enlargement of the right lobe of the thyroid gland, slight hyperplasia of the bronchial and mesenteric glands, moderate degree of meningitis, calcareous plate in the walls of the superior longitudinal sinus, gray atrophy of the optic nerves, commissure and tract, general venous engorgement.

Microscopical report: Nerve tissue: Moderate degree of chromatolysis, pericellular and perivascular spaces well marked, extensive vascular engorgement, central canal of the spinal cord filled with epithelial cells, infiltration of the gelatinous substance with epithelial cells, thickening of the walls of the vessels of the choroid plexus. Heart: Moderate degree of perivascular increase of fibrous tissue, fatty infiltration of the right ventricle. Artery: Considerable endarteritic thickening of the intima most marked in the medium sized and small vessels, some perivascular round cell-accumulation in the external coat. Thyroid gland: Dilatation of some of the vesicles, contents of many of the smaller ones more or less infiltrated with epithelial cells. Lungs: Dilatation of some of the vesicles and thickening of their walls. Bronchial glands: Extensive blackish pigmentation, infiltration and central fibrosis. Pituitary Body: Intense engorgement, foci of round cell-infiltration in the posterior portion. Adrenals: Intense engorgement, capsule thickened, many groups of cortical cells vacuolated and cloudy. Spleen: Intense engorgement, malpighian bodies small but well defined. Liver: Intense engorgement, cells in the center of the lobule considerably pigmented, localized areas in which the protoplasm is vacuolated and some-

what cloudy. **Kidneys:** Capsule somewhat thickened, extensive diffuse interstitial fibrous tissue increase involving all the structures, many glomeruli more or less fibroid and small, extensive engorgement, walls of the blood vessels thickened.

RECURRENT MELANCHOLIA.

205. Female. Age 58. Second admission. Psychosis: Recurrent melancholia. Reported melancholy, restless, sleepless, apprehensive, at times dull and loss of memory, moaning and groaning, wringing her hands, wanting to run away, threatens to kill herself.

Duration of psychosis: Fourteen months.

Cause of death: Acute malignant endocarditis.

Clinical report: Recommitted July, 1905. Age 58, with a psychosis of recurrent melancholia, beginning two months before admission with depression and suicidal inclinations which continued until death. Physically was fairly well nourished when admitted, but was sallow. Examination February, 1906, revealed considerable emaciation and jaundice. Skin flabby and dry, finely scaly; marked dyspnoea, slight oedema of the ankles, some bulging of the abdomen; more or less oval tumor in the left lumbar region movable in all directions, most so upward, slightly tender on pressure; epigastric tenderness and increased resistance, an irregular mass in the right lumbar region, also slightly movable. Blood examination: The characters of a moderate secondary anemia. Some weeks later the mass on the left side was enlarged and was diagnosed as the spleen. There was a well marked nitral systolic murmur, the epigastric tenderness and resistance was more marked, general anasarca developed, dyspnoea became extreme, cyanosis cardiac enlargement and arrhythmia. Jaundice and gradual emaciation and exhaustion.

Pathological report: Extensive cardiac hypertrophy, some cardiac dilatation, extensive warty vegetation on the auricular surface of the mitral cusps, several small endocardial ulcerations in the left auricle, sclerosis of the aortic cusps, extensive arteriosclerosis and atheromatosis with foci of calcareous infiltration, the right coronary orifice being almost occluded by the atheromatous accumulation, chronic pleuritic adhesions bilaterally, right cavity obliterated, right lung collapsed, hypostatic pneumonia of the lower lobe of the left lung, a marginal infarct six mm. deep on its anterior margin, slight oedema of the upper lobe, congestion of the bronchial mucosa, hyperplasia and pigmentation of the bronchial glands. Sero-pyo-peritoneum, acute purulent peritonitis. Cirrhosis of the liver, extensive dilatation of the portal veins, portal phlebitis, chronic nephritis, ovarian atrophy, multiple uterine fibroids, hyperplasia and displacement of the spleen, hyperplasia of the mesenteric and retroperitoneal glands.

Microscopical report: Heart: Moderate degree of perivascular fibrous tissue increase, typical granulation tissue formation of the vegetations. Lung: An occasional tubercular mass, many vesicles filled with blood, the remainder a few leucocytes and

epithelial cells. Spleen: Intense engorgement, extensive thickening of the blood vessel walls with narrowing of the lumen, increase of the interstitial fibrous tissue; malpighian bodies small, many scarcely differential from the splenic pulp. Pancreas: Diffuse increase of the interstitial fibrous tissue, walls of the blood vessels and ducts thickened. Kidneys: Diffuse interstitial and fibrous and round cell increase, tubular epithelium desquamated and granular in the convoluted tubules, some filled with a hyaline material capsule of many glomeruli, thickened engorgement of the blood vessels. Liver: Extensive engorgement, portal vessels extensively dilated and their walls thickened more or less, increase of periportal tissue and some round cell collections, hepatic cells in center of lobules destroyed and represented by a more or less fatty or granular debris, blood and granular material, those in the periphery of the lobule small and atrophic, increase of the leucocytes in the intercellular spaces. Arteries: Moderate endarteritic proliferation of the intima. Stomach and intestines: Proliferation of the mucosal epithelium, hyperplasia of the lymph follicles.

216. Male. Age 65. Second admission. Psychosis: Recurrent melancholia. Reported depressed, melancholia, suicidal, homicidal with delusions that he had been cheated in trades and that his family would come to want. Beginning about six months prior to admission.

Duration of psychosis: Six months.

Cause of death: Asphyxia by strangulation.

Clinical report: Admitted September, 1906, age 55, with a psychosis of subacute melancholia beginning about six months before admission. On admission there was moderate depression with amnesia for recent events and delusions of personal unworth. He was an inmate from November 2 to January 8, for a similar depressed condition. After admission there was apparent gradual improvement; became more cheerful and clearer mentally, only occasionally becoming depressed in regard to his health. Committed suicide by tying a handkerchief around his neck and fastening it to the bedpost. Physically on admission there was marked evidence of senility, weakness, dyspnoea, slight oedema of the ankles, marked arteriosclerosis, cyanosis on exertion. Was confined to bed for almost a year prior to admission on account of nephritis. Since admission there has been gradual failure, frequent fainting attacks with bradycardia, cyanosis and arrhythmia, physical signs of myocarditis and dilatation of the aorta.

Pathological report: Cardiac hypertrophy, sclerosis of the mitral and aortic valves, chronic myocarditis, extensive arteriosclerosis, atheromatosis and some calcareous vessels especially the right, slight apical pulmonary oedema, chronic gastritis, extensive chronic nephritis with numerous cortical cysts, hyperplasia of the spleen, chronic pachy and leptomeningitis, moderate increase of subdural fluid, sclerotic area in the anterior part in the upper portion of the left temporosphenoidal lobe, cystic choroid plexus, general venous congestion.

Microscopical report: Nerve tissue: Extensive chromatolysis of the cortical cells in the cerebrum and moderate of the anterior horn cells of the cord, central canal of the cord filled with epithelial cells, also infiltration of the central gelatinous substance with them, in the sclerotic area of the left temporosphenoidal lobe the blood vessels are extremely dilated and extremely engorged with blood. The neuroglial tissue is increased and diffused, through it are numerous spherical hyaline bodies. Heart: Considerable increase of thickness of pericardium over the right ventricle, considerable round cell collection in its deeper layers, considerable epicardial fat. Extensive more or less strandlike increase of interstitial fibrous tissue. Artery: Extensive endarteritic proliferation of the intima with more or less atheromatous degeneration. Lung: Dilatation of many of the vesicles, thinning of their walls. Thyroid gland: Dilatation of many vesicles, remainder small, more or less tubelike and contain little or no colloid material. Choroid plexus: Blood vessel walls thickened, numerous concentric hyaline bodies: Pancreas: Slight increase of interstitial fibrous tissue. Spleen: Intense engorgement, walls of the blood vessels thickened, malpighian bodies small. Liver: Intense engorgement, foci of granular degeneration on the cortex, scattered foci of dense round cell accumulation in the medulla. Kidneys: Capsule thickened, intense engorgement, walls of the blood vessels thickened, extensive bandlike strands of fibres tissue extending from the capsule inward taking the place of the normal tissue of the kidney at places, at others infiltrating through it, diffuse intertubular increase, some of the tubules dilated, epitheliums shallow, tending to form cyst like spaces, some of the glomeruli surrounded by considerable fibrous tissue causing contraction of them.

ACUTE MANIA.

191. Female. Age 50. First admission. Psychosis, acute mania. Reported restless, incoherent shouting, destructive, violent, with great psychomotor activity, requires restraint.

Duration of psychosis: Two weeks.

Cause of death: Maniacal exhaustion.

Clinical report: Admitted January 31, 1906, age 50, with a psychosis of acute mania beginning about one week before in a sudden outbreak of maniacal excitement without any previous mental or physical disturbance, except perhaps some irritability at the meal time immediately preceding the outbreak. For several times previous to the onset the patient had been more active in religious matters than formerly, devoting all her spare time to it. On admission the psychomotor activity was so pronounced that she refused to take food, so required feeding and could only be quieted by hypodermics of large doses of hyoscin. Married 25 years, no children, passed the menopause five years ago, was never sick and had not taken any medicine since childhood; one sister insane.

Pathological report: Moderate cardiac hypertrophy, extensive fibroid sclerosis of the mitral valves, causing considerable narrowing of the orifice. Extensive epicardial fat over the right ventricle. Moderate arteriosclerosis, dilatation of the right side of the heart, chronic diffuse pleuritic adhesions, moderate pulmonary hypostasis, congestion of the bronchial mucosa, cloudy appearance of the liver, chronic nephritis with cyst formation, cystic right ovary, cervical polypus of the uterus, increase of subdural fluid, general cerebral atrophy, some cerebral oedema sacral decubitus.

Microscopical report: Nerve tissue: Moderate chromatolysis, blood vessels and capillaries engorged, a few parivascular spaces contain more or less round cell infiltration, central canal of the cord filled with epithelial cells. Heart: Extensive fatty infiltration of the right ventricle, extensive increase of interstitial fibrous tissue. Artery: Moderate endarteritic thickening of the intima with considerable parivascular round cell infiltration in the adventitia. Gasserian ganglion: Foci of round cell collections scattered throughout. Spleen: Intense engorgement, increased thickening of the walls of the blood vessels, malpighian bodies dense, some more or less diffuse. Liver: Intense engorgement, slight increase of fibrous tissue in the portal fissures, some round cell collections about many bile ducts, protoplasm of the liver cells more or less filled with unstained areas. Kidneys: Extensive diffuse increase in fibrous tissue, dilatation of many of the tubules, epithelium shallow lumen of many containing a granular debris. Walls of the blood vessels thickened, extensive capillary engorgement, moderate parivascular leucocytic increase. Lung: Many vesicles filled with blood and the adjoining alveolar capillaries engorged, some vesicles more or less filled with leucocytes and epithelial cells, walls of the blood vessels thickened, more or less vascular pigmentary infiltration.

CHRONIC MANIA.

187. Female. Age 51. First admission. Psychosis: Chronic mania.

Reported furious and destructive at times more or less, maniacal desire to marry one or a half dozen men.

Duration of psychosis: Twenty-five years.

Cause of death: Mammary carcinoma.

Clinical report: Admitted in December, 1881, with a psychosis of acute mania beginning three months before admission; was more or less maniacal; physical condition was good. A mammary carcinoma developed on the right side which led to extensive ulceration and general emaciation and exhaustion.

Pathological report: Carcinoma of the right breast. Carcinomatous enlargement of the axillary and cervical glands on the right side, purulent pericarditis, pyo-pericardium, slight cardiac hypertrophy, slight sclerosis of the mitral valves, general moderate arteriosclerosis, right pyo-thorax, right chronic purulent

pleuritis, chronic pleuritic adhesions on both sides, carcinomatous masses in both lungs, foci of pneumonic consolidation with central caseation and cavity formation, chronic bronchitis, hyperplasia pigmentation and caseation of the bronchial glands, carcinomatous nodules in the liver, chronic pancreatitis, chronic nephritis, ovarian and uterine atrophy. Atrophy of the spleen, calcareous and nodular infiltration of the medullary part of the adrenals. Cystic thyroid gland, adenomatous lymphatic glands, chronic meningitis, dilatation of the lateral ventricles, cystic pineal glands, granular ependyma, calcification of the costal cartilages, sacral decubitus, coppercolored cicatrices over both tibia.

Microscopical report: Nerve tissue: Moderate chromatolysis, central canal of the cord filled with epithelial cells. Heart: Pericardium of the right ventricle thickened, and covered by a layer of granulation tissue and superficially of debris, more or less dense infiltration with round cells and engorgement of the capillaries, extensive fatty infiltration of the right ventricle, extensive increase of the interstitial fibrous tissue. Artery: Moderate diffuse endarteritic thickening of the intima. Lung: Pleura swollen, thickened, infiltrated more or less with round cells covered by a layer of granulation tissue, engorgement of the blood vessels and alveolar capillaries, moderate perivascular pigmentary infiltration, foci of filling of the vesicles with round cells, in some parts the collection of cells limited to the vesicular cavity, in other places taking the place of lung tissue. Thyroid gland: Dilatation of many of the vesicles, colloid content of the smaller vesicles more or less infiltrated with epithelial cells, a mass of epithelial cell collection with the cells arranged more or less into tubules. Adrenals: Mass of epithelial cell collection assuming a more or less alveolar arrangement, foci of round cell accumulation in the medulla. Spleen: Thickening of the corpuscles and blood vessels, malpighian bodies dense diffuse hyperplasia of lymph cells. Kidneys: Diffuse increase of interstitial fibrous tissue, most marked in the medullary portion, some periglomerular increase, a few fibroid whorls. Liver: Considerable venous engorgement, central cells of the lobule small, pigmented and atrophic, foci and masses of epithelial cells arranged more or less into alveoli and displacing the normal liver cells. Mammary glands: Dilatation of many alveoli and filling with epithelial cells, increase tubular formation both surrounded by round cell collection. Masses of epithelial cells assuming an irregular more or less alveolar arrangement with a framework of dense fibrous tissue, infiltration at places by collections of round cells.

195. Female. Age 66. First admission. Psychosis: Chronic mania. No report given.

Duration of psychosis: Twenty-nine years.

Cause of death: Acute pericarditis.

Clinical report: Admitted April, 1887, with a psychosis of mania. Mental condition after admission was one of gradually increasing dementia. Physically her health has been good. While return-

ing from the dining-room to the ward she was taken with a sudden attack of dyspnoea, rapidly became unconscious, and died in about fifteen minutes.

Pathological report: Oedema of the lungs, acute exudative pericarditis, extensive cardiac hypertrophy, dilatation of the right side of the heart, chronic myocarditis, sclerosis of the mitral and aortic valves, general arteriosclerosis, chronic bilateral pleuritic adhesions, bilateral hydrothorax, slight pulmonary oedema, foci of pneumonic consolidation, focus of caseation and calcareous infiltration, chronic nephritis, ovarian atrophy, chronic meningoencephalitis, general cerebral atrophy, cystic choroid plexus, fragilitas ossium.

Microscopical report: Nerve tissue: Extensive chromatolysis moderately in the anterior horn cells of the cord, some perivascular round cell infiltration, involving mostly the medium sized vessels, proliferation of the epithelium of the central canal of the cord. Heart: Pericardium thickened infiltration with round cells, engorgement of the vessels, layers of fibrin on the surface, extensive fatty infiltration of the right ventricle, moderate degree of fibrous tissue increase. Lung: Thickening of the alveolar walls and of the walls of the blood vessels, moderate degree of perivascular blackish pigmentation in noncollapsed portions, vesicles irregular, some dilated, walls thinned and broken, foci of filling of the vesicles with leucocytes and epithelial cell usually surrounding or adjoining a bronchiole with some giant cells, some peribronchial fibrous tissue increase. Thyroid gland: Dilatation of some of the vesicles, the colloid content of some of them have unstained globular areas, content of some of the smaller vesicles more or less infiltrated with epithelial cells. Intestines: Considerable vascular engorgement. Adrenal: Intense engorgement, foci of round cell collection in the cortex. Spleen: Intense diffuse engorgement, thickening of the blood vessels, malpighian bodies small but well defined. Kidneys: Intense engorgement, walls of the blood vessels thickened, moderate diffuse interstitial fibrous tissue increase, foci of round cell infiltration mostly subcapsular. Liver: Moderate periportal interstitial increase of fibrous tissue and round cells, dilatation of the central interlobular spaces, atrophy and pigmentation of the liver cells.

197. Female. Age 29. First admission. Psychosis: Chronic mania. Reported incoherent in speech and action, flighty in ideas, and acute maniacal psychomotor restlessness.

Cause of death: Pulmonary tuberculosis.

Clinical report: Admitted May, 1902, with a psychosis of acute mania beginning three months before admission. The course of the mental disturbance was one of progressive deterioration. On admission there was a discharging sinus about 1 cm. about the center of Poupart's ligament on the right side, leading down to the right pelvic cavity. About November, 1905, manifestations of pulmonary tuberculosis developed, cough, emaciation, chills, anorexia, coated tongue, and evening temperature with physical

manifestations of dulness, crepitant rales, bronchial breathing, vocal fremitus, and increased tactile fremitus.

Pathological report: Slight hydropericardium, cardiac dilatation, general arteriosclerosis, both pleural cavities obliterated, by firm adhesions, extensive tubular involvement of both lungs, with extensive cavity formation in the apices of all the lobes, most marked in the upper lobes, chronic bronchitis, hyperplasia, pigmentation and caseation of the bronchial glands, chronic perihepatic adhesions, cirrhosis of the liver, chronic purulent appendicitis, chronic pelvic peritonitis, chronic nephritis, cystic condition of both ovaries, chronic double pyosalpinx, suppurative and cystic mass in the left broad ligament, uterus misplaced and firmly bound down to the right side; chronic cystitis, acute perforating ulcer of the posterior wall of the bladder opening into a suppurative cavity which leads to an opening above the center of Poupart's ligament, on the right side. Hyperplasia of the spleen, infarct of the spleen, hyperplasia of the mesenteric and retroperitoneal lymph glands. Atrophy of the thyroid glands.

Microscopical report: Nerve tissue: Moderate chromatolysis, pericellular and vascular spaces well marked, pituitary body considerably engorged. Heart: Some perivascular increase of fibrous tissue. Thickening of the walls of the blood vessels, small size of the muscle fibres. Artery: Moderate degree of endarteritic proliferation. Lung: Foci and masses of tubercular formation in various degrees of degeneration, many of the intervening vesicles dilated with thinning of the walls, extensive engorgement of the alveolar capillaries, otherwise with rupture of some of the capillaries and filling of the surrounding vesicles with blood. Bronchial glands: Extensive infiltration with foci of typical tubercular formation in varying stages of degeneration, extensive diffuse blackish pigmentary infiltration. Pancreas: Moderate degree of interstitial fibrous tissue increase. Spleen: More or less engorgement, very few malpighian bodies visible, those present small, some increase, extending in more or less strandlike bands from the capsule inward involving all of the structures, considerable thickening of the walls of the blood vessels. Liver: Extensive engorgement, dilatation of the intercellular spaces, in the center of the lobule, atrophy and pigmentation of the adjoining liver cells, increase of the interstitial fibrous tissue and foci of round cell infiltration, scattered nodules of typical tubercular formation in various stages of degeneration, some fatty infiltration in the periphery of the lobule.

217. Female. Age 85. First admission. Psychosis: Chronic mania. No report given.

Duration of psychosis: Ten and more years.

Cause of death: Chronic myocarditis.

Clinical report: Admitted September, 1896, as a chronic mania. After admission she was at times noisy and excitable, and underwent a gradual progressive dementia. Physically her health was fairly good at first, but later attacks of dyspnoea, cardiac failure

and exhaustion were manifested. Death was sudden, with apparent collapse.

Pathological report: Chronic myocarditis, extensive sclerosis and calcareous infiltration of the mitral and aortic valves. Extensive arteriosclerosis and atheromatosis, dilation of the arch of the aorta, firm pleuritic adhesions on the left side, pulmonary hypostasis, congestion of the bronchial and tracheal mucosa, cirrhosis of the liver, cicatricial contraction of the gall-bladder, chronic pancreatitis, chronic nephritis with cyst formation, senile atrophy of the uterus and ovaries, perisplenitis, enlarged cystic right lobe of the thyroid gland, hyperplasia of the mesenteric glands, chronic meningoencephalitis, general cerebral atrophy, thrombotic occlusion of the right middle cerebral artery, with softening of the brain supplied by it.

Microscopical report: Nerve tissue: Vascular engorgement, some perivascular round cell infiltration. Heart: Moderate degree of fatty infiltration of the right ventricle. Moderate degree of fibrous tissue, increase most marked in the perivascular spaces. Artery: Extensive endarteritis proliferation of the intima, atheromatous degeneration of the deeper portion, thickening of the middle and outer coats with rather extensive focal infiltration, with round cells most marked in the external coat. Thyroid gland: Extensive diffuse increase of fibrous tissue, at places forming a dense almost hyaline structure, masses of hyaline appearing material containing collections of epithelial cells, forming small nests or arranged tubularly, or at times alveolarly, the cells appearing somewhat fragmentary and the nuclei staining deeply, many cystlike spaces containing no colloid content, at places the structure appears distinctly oedematous. Lung: Intense vascular engorgement, some of the alveolar capillaries ruptured, the adjoining vesicles containing more or less blood, other areas in which the vesicles contain round cells and a few epithelial cells, pleura thickened and infiltration in its deeper portions by more or less diffuse blackish pigmentary infiltration most marked in the medullary portion, by more or less diffuse round cells, walls of the blood vessels thickened. Bronchial glands: Hyperplasia of the lymph follicles, more or less diffuse blackish pigmentary infiltration. Adrenals: Diffusely scattered foci of round cell infiltration, most marked in the medullary portion, fibroid thickening of the capsule. Spleen: Capsule thickened, portions of it being densely fibroid, trabeculae prominent, malpighian bodies prominent and well defined areas of diffuse lymph cell infiltration, walls of the blood vessels extensively thickened, areas of intense engorgement. Liver: Moderate engorgement, extensive increase of fibrous tissue infiltration in bandlike strands between the individual lobules and groups of lobules with extensive focal round cell infiltration and proliferation of the bile ducts. Kidneys: Extensive fibroid thickening of the capsule, extensive diffuse fibrous tissue increase and round cell infiltration most marked beneath the capsule, about the glomerulli, and in the me

dullary portion, the epithelium of the convoluted tubules is cloudy, outline is indistinct, nuclei staining faintly or not at all, some more or less granular, extensive fibrous tissue increase in and about the glomeruli, many whorl-like, more or less nuclear proliferation, walls of the cysts containing a dense fibrous tissue with extensive subcapsular round cell infiltration, walls of the blood vessels extensively thickened, more or less vascular engorgement.

220. Male. Age 58. First admission. Psychosis: Chronic mania. Reported weak-minded, morally bad, intemperate, indolent, preaching, singing, striking and attacking citizens.

Duration of psychosis: Seventeen years.

Cause of death: Pulmonary oedema.

Clinical report: Admitted October, 1890, with a psychosis of subacute mania, beginning some time in 1889. His previous life was more or less that of a tramp, dirty, filthy, weak-minded, immoral, intemperate, spending his time wandering about the country, sometimes fishing. After admission there was a rapid disappearance of the violence and noisiness; hallucinations of sight and hearing developed, but he became quiet and worked considerably about the ward. The physical health was good until about ten days before death, when a carbuncle developed on the back of the neck, but he did not complain of anything beyond that. On the morning of his death he complained of dyspnoea and of being sick when he arose for breakfast and immediately thereafter he returned to bed. Dyspnoea becoming extreme, restlessness, profuse perspiration, rolling and tossing in bed until death.

Pathological report: Urine was found to contain sugar, carbuncle of the neck, slight hydropericardium, cardiac hypertrophy, dilatation of the right auricle, sclerosis of the mitral and aortic valves, calcareous infiltration of the aortic valves, fatty infiltration of the heart, chronic myocarditis, extensive arteriosclerosis, arteriomatosis, atheromatous ulcerations and some calcareous infiltration of the arteries, dilatation of the aorta, bilateral hydrothorax, chronic pleuritic adhesions on the right side, extensive pulmonary oedema, bronchi and trachea filled with a viscid frothy fluid, hyperplasia and pigmentation of the bronchial glands, hyperplasia of the mediastinal glands. Fatty cirrhosis of the liver, chronic gastritis, chronic nephritis, hyperplasia of the spleen, softening of the adrenal medulla, cystic enlargement of the thyroid gland, adenoma of the right lobe of the thyroid, hyperplasia of the lymphatic glands in general, chronic meningitis, extensive increase of the subdural and subarachnoid fluid, general cerebral atrophy, foci of cerebral softening, cystic choroid plexus, granular ependyma.

Microscopical report: nerve tissue: Extensive chromatolysis, walls of the blood vessels extensively thickened, considerable vascular engorgement, diffuse foci of round cell infiltration, points of sclerosis, proliferation of the ependymal cells. Heart: Moderate increase of the interstitial fibrous tissue, more or less strandlike,

muscle fibres large. Artery: Extensive endarteritic proliferation of the intima, more or less atheromatous degeneration of the deeper portion, foci of round cell infiltration in the middle and external coats. Lung: Many of the vesicles dilated and the alveolar walls thinned, extensive increase of fibrous tissue, proliferation of the bronchial mucosal epithelium, moderate perivascular and peribronchial blackish pigmentary infiltration. Bronchial glands: Hyperplasia of the lymph follicles, more or less blackish pigmentary infiltration. Pineal gland: Mass of epithelial cells somewhat spindle shaped, more or less alveolated, numerous concentric and calcareous bodies. Pituitary body: Fibroid thickening of the capsule. Diffuse increase of fibrous tissue, intense engorgement. Thyroid gland: Diffuse increase of interstitial fibrous tissue, extensive dilatation of some of the vesicles, diffuse foci of round cell infiltration, many of the smaller vesicles more or less infiltrated with epithelial cells. Intestines: Hyperplasia of the lymph follicles. Adrenal: Intense engorgement, numerous foci of round cell infiltration in the medullary portion, less so in the cortical part. Spleen: Extensive engorgement, malpighian bodies small, some diffuse increase of lymph corpuscles. Liver: Extensive engorgement, slight diffuse increase of fibrous tissue and some round cell infiltration, protoplasm of the liver, cells cloudy and somewhat vacuolated in appearance. Kidney: Extensive diffuse increase of inflammatory tissue forming in some places dense masses of fibrous tissue, at others more cellular, most marked in the medullary portion, and in and about the glomeruli, most of the glomeruli are more or less fibroid, some whorl-like with more or less nuclear increase, some of the tubules are dilated into cystlike spaces, in others the epithelium is somewhat granular, blood vessels are extensively thickened, mostly the middle and external coat, more or less vascular engorgement.

RECURRENT MANIA.

185. Male. Age 66. Fourth admission. Psychosis: Recurrent mania. Reported excitable, incoherent, sleepless, destructive, violent, tearing clothing, homicidal, dancing, singing, swearing, requiring restraint.

Duration of psychosis: About five years.

Cause of death: Acute malignant endocarditis.

Clinical report: Admitted March, 1901, with a psychosis of acute mania, beginning one month before admission. After admission he was very noisy and excited, with intense psychomotor activity, requiring restraint day and night. Physically his health was good up to within a month of his death. Toward the latter part of November, 1905, he became very quiet, sat by the radiator most of the time, complained of pain in the left side of the chest, dyspnoea and cough. Was married, painter by occupation, was an inmate three times before this one, had cataract in both eyes, gave a history of syphilis and several attacks of gonorrhoea.

Pathological report: Extensive firm adhesions of the pericardium, occluding the cavity, cardiac dilatation and hypertrophy, acute ulcerative endocarditis, myocarditis, sclerosis of the mitral and aortic valves, extensive arteriosclerosis, atheromatosis, and calcareous infiltration of the arteries, dilatation of the aorta, chronic pleuritic adhesions bilaterally, extensive hydrothorax, pulmonary oedema, congestion of the bronchial mucosa, cirrhosis of the liver, chronic persplenitis, chronic nephritis, chronic pachy and leptomeningitis, extensive external hydrocephalus, cystic and calcareous deposits in the choroid plexus, bilateral cataract, ossification of the costal cartilages, oedema of the lower limbs.

Microscopical report: Nerve tissue: Moderate chromatolysis, central canal of the cord filled with epithelial cells which also infiltrate more or less the central gelatinous substance. Heart: Extensive thickening of the pericardium by fibrous tissue formation and round cell infiltration, between it and the epicardium granulation tissue in the various stages of formation with some fat cells, epicardium swollen and indistinct, some fatty infiltration of the heart muscles, muscle fibres swollen, moderate increase of fibrous tissue, with some foci of round cell accumulation. Artery: Extensive endarteritic thickening of the intima, degeneration of its deeper parts, some thickening of the middle and external coats. Thyroid gland: Some of the smaller vesicles more or less cellular infiltration of the colloid contents. Lung: Dilatation of some of the vesicles with thinning of the walls, otherwise capillary engorgement, some vesicles filled with round cells, and a few epithelial cells, others contain some homogeneous material, with a few leucocytes, and epithelial cells. Pituitary body: Intense engorgement, some increase of fibrous tissue. Spleen: Fibrous thickening of the capsule, considerable engorgement, malpighian bodies dense, diffuse increase of leucocytes. Liver: Intense engorgement, destruction of the liver cells in the center of the lobule to a greater or lesser degree, moderate increase of fibrous tissue. Kidneys: Moderate increase of interstitial fibrous tissue, tubules dilated, epithelium shallow, many filled with a somewhat granular debris, increase of periglomerular and interglomerular fibrous tissue, walls of the blood vessels extensively thickened, involving all the coats.

CIRCULAR INSANITY.

215. Female. Age 60. First admission. Psychosis: Circular insanity. Reported as having periods of melancholic depression alternating with periods of maniacal excitement, the latter condition predominating.
- Duration of psychosis: Not given.
- Cause of death: General septic peritonitis.
- Clinical report: Admitted August, 1905, with a psychosis of melancholic depression. After admission this gave way to one of maniacal excitement. These periods alternated at irregular in-

tervals. About ten days before death she was taken with a complete left hemiplegia, which disappeared at the end of three days. She recovered sufficiently to be about when she was taken with a severe attack of entero-colitis, content of the stools containing some blood, with a temperature of 102, which subsided in about five days. On the morning preceding death it was found that she could not urinate, catheterization was tried, but was unsuccessful; suprapubic aspiration was performed and about 750 cc. of thick purulent looking amoniacal urine was drawn off. She later became comatose, which gradually deepened until death supervened.

Pathological report: Slight sclerosis of the mitral valves, fatty infiltration of the right ventricle, moderate arteriosclerosis, chronic pleuritic adhesions on the right side. Pulmonary hypostasis, hyperplasia of the bronchial glands, haemoperitoneum, general septic peritonitis, chronic pancreatitis, urethral stricture, chronic cystitis, ulcerative perforation of the posterior wall of the bladder, chronic nephritis, suppurative pyelitis pyoureter, atrophy of the spleen, atrophy of the thyroid gland, chronic pachy and leptomeningitis, chronic external hydrocephalus, general cerebral atrophy, cystic choroid plexus, granular ependyma.

Microscopical report: Nerve tissue: Extensive round cell infiltration of the arachno pia mater, most marked about the blood vessels, the infiltration following the blood vessels entering the cortex, completely filling up the perivascular spaces, and the blood vessels themselves at some places, all the perivascular spaces throughout the cortex more or less filled the walls of the blood vessels thickened most marked in the middle coat. Heart: Moderate fatty infiltration of the right ventricle, extensive interstitial fibrous tissue increase, most marked about the blood vessels, and in the deeper layers of the muscles, walls of the blood vessels thickened, affecting the middle coat mostly. Thyroid: The smaller vesicles more or less infiltrated with epithelial cells. Choroid plexus: Increase of fibrous tissue, walls of the blood vessels thickened, numerous hyaline concentric bodies. Pineal gland: Made up of a mass of epithelial cells more or less arranged into alveoli and containing calcareous and hyaline concentric bodies. Lung: Thickening of the pleura by fibrous tissue increase, the subpleural vesicles more or less collapsed and the alveolar capillaries enlarged, many of the deeper vesicles more or less dilated, the walls thinned, and some ruptured, many of the bronchioles filled with round cells, also a few epithelial cells. Mesentery: Extensive hyperplasia of the lymph glands and foci of round cell collection. Stomach: Dense foci of round cells in the mucosa, some proliferation of the mucosa epithelium. Spleen: Intense engorgement, scattered foci of fibrous tissue increase and some round cells in some of the portal fissures. Kidney: Proliferation, degeneration and necrosis of the pelvic epithelium, dense infiltration of masses of round cells in the mucosa and submucosa, some diffuse fibrous tissue increase foci of dense

round cell infiltration scattered throughout the medulla, convoluted tubular epithelium swollen, more or less granular, walls of the blood vessels thickened, more or less vascular engorgement. Bladder: Peritoneal coat and much of the muscular coat swollen and densely infiltrated superficially with round cells, more or less engorged epithelium of the mucosa proliferated and in the neighborhood of the ulcer more or less degenerated and necrosed. Appendix: Swelling and infiltration with round cells of the peritoneal and muscular walls, hyperplasia of the lymph follicles, perivascular spaces filled with round cells.

EPILEPTIC INSANITY.

182. Male. Age 27. Second admission. Psychosis: Epileptic mania. Reported answering questions in a rambling way; imagined he committed some crime; expects money to come for his release; assumes a peculiar attitude.

Duration of psychosis: Eleven years.

Cause of death: Hypostatic pneumonia and status.

Clinical report: Admitted June, 1904, age 27, with a psychosis of epileptic mania. He was later discharged but recommitted in September, 1904. His mental condition on admission was one of mania. He has been subject to post epileptic maniacal outbreaks for eleven years, necessitating his confinement in the jail frequently, becoming violent, destructive and dangerous to his surroundings. There was gradually progressive dementia. His physical condition on admission was good, but he soon began to grow weak and lose flesh; about October he began to have the convulsions more frequently and was almost continually violent and excited. He seemed to lose control of his legs and could not walk without assistance. About November he had a left rib fractured in a struggle with the attendants. For two days preceding death he was in a condition of status.

Pathological report: Extensive pulmonary hypostatic pneumonia, small focus of localized gangrene in lower lobe, passive congestion of the smaller bronchioles, fracture of the ninth left rib, subepicardial ecchymosis, cardiac hypertrophy, slight arteriosclerosis, submucous gastric ecchymosis, chronic nephritis, splenic hyperplasia, chronic meningitis.

Microscopical report: Nerve tissue moderate degree of chromatolysis, H. and E., central canal of spinal cord filled with desquamated cells. Heart: Moderate degree of fibrous tissue increase and also fatty infiltration of the superficial part of the right ventricle. Artery: Moderate degree of endarterial thickening and some of the middle coat. Thyroid gland: Considerable irregularity in size of the vesicles, the colloid material in the smaller ones containing more or less desquamated epithelial cells. Lung: Engorgement of the alveolar capillaries and blood vessels, vesicles in some part filled with blood, pus, a few leucocytes and epithelial cells, more or less diffuse perivascular blackish pigmentation.

Bronchial glands: Made up mostly of foci centrally degenerated and granular, surrounded by zones of more or less fibrous tissue, then a cellular zone and intense engorgement of the blood vessels, more or less blackish pigmentation diffused throughout and some calcareous deposit surrounding the degenerated area. Spleen: Intense engorgement, malpighian bodies small and dense, diffuse distribution of lymphatic cells, and relative increase in trabecular formation. Liver: Intense engorgement of the central portion of the lobules, dilatation of the intercellular spaces, atrophy and extensive pigment content of the central cells. Foci of the periportal fibrous tissue and small round cell increase. Kidneys: Intense diffuse vascular engorgement, moderate increase of interstitial tissue, most marked in the medullary portion and in and around Bowman's capsule.

186. Male. Age 37. Second admission. Psychosis: Epileptic imbecility. Reported irritable, violent, destructive and imbecile. Developed epilepsy at age of 16, attributed to sunstroke and leading to more or less imbecility.

Duration of psychosis: Seven years.

Cause of death: Pneumonia.

Clinical report: Admitted October, 1898, age 31, with a psychosis of epileptic insanity. Discharged improved, September, 1902. Readmitted December, 1904. One maternal uncle epileptic, one cousin insane. No report of severe illness or injury in childhood. At age of 16 developed major epilepsy, attributed to sunstroke. Ten years later the left eyeball began to bulge but was not considered of importance. Four years later right hemiplegia developed. Seizures had no discoverable auras and no focal prodromata; mental state one of arrested development. Irritable before seizure, often violent following them; amiable during the interval. Medium height, powerful muscular development, bulging of the cranium over the left orbital space, percussion note flat, a feeling of resistance apparently not sensitive to pressure, both eyes prominent, the left more so; pupils unequal, react slowly to light, no ocular palsies, extreme optic atrophy; mouth drawn to the left, speech confined to half dozen words, partially recovered right hemiplegia, contracture of the right hand and foot, knee jerks exaggerated, right ankle clonus. Babinsky reaction present, marked dementia. December, 1905, fell and fractured the right inferior maxilla near the angle. Three days later serial convulsions and pneumonia.

Pathological report: Pneumonia consolidation of the lower lobe, posterior portion of the middle lobe and base of upper lobe of the right lung; hypostasis of the posterior portion of the lower lobe of the left lung, emphysema of the upper middle right lobes. Acute bronchitis right side, localized acute pleurisy right side; chronic pleuritis, adhesions bilateral; fracture of the right inferior maxilla with operation scar over it, bilateral exophthalmus, head brachy-cephalic, bulging of the left fronto orbital region, irregular thinning and thickening of the cranial bones. Multiple tumor

of the brain. Displacement and atrophy of the greater portion of the anterolateral part of the left cerebral hemisphere, atrophy of the optic nerves, atrophy of the right cerebellar hemisphere, chronic meningitis, chronic nephritis, right hydronephritis, right hydro ureter, right renal calculus, right pyelitis, moderate general arterio-sclerosis, fatty infiltration of the right heart.

Microscopical report: Nerve cells: Extensive chromatolysis, central canal filled with proliferated epithelial cells which also infiltrate the surrounding central gelatinous substance. Pituitary body engorgement. Heart: Moderate fibrous tissue increase in the left ventricular wall and fatty infiltration of the right ventricular walls. Artery: Moderate degree of endarteritic thickening. Thyroid: Dilatation of many of the vesicles and distention with colloid material, causing flattening of the lining epithelium; the colloid content of many of the smaller vesicles more or less infiltrated with epithelial cells. Spleen: Extensive engorgement, malpighian bodies small and few in number. Liver: Dilatation of the intercellular spaces in the center of the lobule, atrophy of the adjoining hepatic cells, slight increase of the fibrous tissue in the portal fissures. Adrenals: Extensive pigmentation of the medullary cells, several foci of round cell accumulation in the cortical part. Right kidney: Extensive diffuse mass of inflammatory corpuscles and fibrous tissue almost wholly displacing the tubular structure, many of the glomeruli represented by fibrous whorls, more or less thickening of Bowman's capsule, blood vessels thickened, lumen narrowed and many almost wholly occluded. Left kidney: Moderate degree of fibrous tissue increase, nuclear proliferation, affecting mostly the glomeruli and periglomerular tissue and the medullary portion leading to considerable thickening of Bowman's capsule.

190. Male. Age 19. First admission. Psychosis: Epileptic insanity. Reported dull of expression, subject to outbreaks of violence and to practice selfabuse and appearance of feeble mind.

Duration of psychosis: Three years.

Cause of death: Status.

Clinical report: Admitted June, 1903, age 19. Epileptic convulsions said to have commenced six years before; mental disturbance dated back three years; conversation, actions and appearance indicate a feeble mind, subject to outbreaks of violence and addiction to selfabuse. Was in status three days.

Pathological report: Nodular pulmonary hypostasis, congestion of the bronchial and trachial mucosa, chronic pleuritic adhesions on the left side. Beginning sacral decubitus, assymetry of the ears, several fat infarcts of the liver, hyperplasia of the lymph follicles in the small intestine, gastric submucusecchymosis, hyperplasia of mesenteric glands, persistent thymus gland, venous engorgement of all the organs.

Microscopical report: Nerve cells: Extensive chromatolysis, H. and E. Extensive vascular engorgement, most marked in the cortex, dilatation of the pervascular spaces. Heart: Moderate

diffuse increase of fibrous tissue and fatty infiltration of the right ventricular wall. Lung: Intense engorgement of the alveolar capillaries, many vesicles filled with blood areas in which they are filled with leucocytes, and epithelial cells, others somewhat dilated. Spleen: Intense engorgement malpighian bodies, many represented by only a few lymph corpuscles surrounding the blood vessels. Liver: Intense engorgement dilating of the intercellular spaces in the center of the lobule, the adjoining cells small. In many lobules the central cells are apparently swollen and do not stain, appearing homogeneous. Pancreas: Lobular outline distinct, no haidehain bodies visible. Kidneys: Intense engorgement, and increase of periglomerular fibrous tissue, about many glomeruli, epithelium of many tubules, stain poorly and appear somewhat swollen. Intestines: Lymphatic structure dense and prominent. Intense vascular engorgement, proliferation of the epithelium.

199. Male. Age 40. First admission. Psychosis: Epileptic insanity. Reported restless, sleepless, destructive, homicidal, feeble-minded from one year of age, following a severe sickness.

Duration of psychosis: Not given.

Cause of death: General tuberculosis.

Clinical report: Admitted September, 1902, age 37. Occupation farmer. Single. At one year of age he had an attack of fever, following which it was seen that he was not like other children, never learned to talk distinctly, could hear and understand, laughs at times, never cries, shows no inclination to play, is amused with small objects, becomes violent to those around him, has had convulsions since two years of age.

On admission mental condition was one of imbecility, with manifestations as reported above. Epileptic seizures are frequent. In the summer of 1904 he developed a left empyema, for which resection of rib was done which eventually healed up and there was a fair degree of lung expansion. About four months before death there came apparent loss in weight and signs of tubercular involvement of the lungs. As the tubercular affection advanced the epileptic seizures became more frequent and uncontrollable.

Pathological report: Extensive nodular tuberculosis of the lungs with caseation, and some calcareous infiltration, chronic bronchitis, chronic bilateral pleuritic adhesions, except a localized empyema beneath the point of operation, lobular emphysema, hyperplasia and tuberculosis of the bronchial glands, brachiocephalic head, assymetry of the head and face and ears, fatty infiltration of the heart, general arterio-sclerosis, and atheromatosis. Tubercular ulceration of the small intestines, tubercular caries of the second and third lumbar vertebrae, psoas abscess, tuberculosis of the liver, hyperplasia of the mesenteric glands, chronic pachy and leptomenigitis, chronic external hydrocephalus, extensive dilatation of the ventricles, and distension with fluid, cystic choroid plexus, granulations of the ependyma throughout, localized

hemorrhage in the anterior extremity of the left temporo-sphenoidal lobe, and the adjoining part of the fissure of sylvius, general cerebral sclerosis, sclerosis of the posterior columns of the spinal cord, most marked in the lumbosacral enlargement, operation scar on the left side of the thorax over the eighth rib, in the posterior axillary line, sacral and trochanteral decubitus. Atrophy of the left testicle.

Microscopical report: Nerve cells: Nissl. Only a moderate degree of chromatolysis. H. and E. Temporo-sphenoidal lobe extensive thickening of the pia, by accumulation of leucocytes, involving the perivascular spaces, extending into and through the cortex, thickening of the vascular walls, involving mostly the media. In the tip of the convolution diffuse, pial haemorrhage extending into and infiltrating the superficial portion of the cortex. In other portions the pia perivascular spaces and blood vessels show a similar leucocytic accumulation and infiltration. Proliferation of the ependymal epithelium, increase of fibrous tissue in the subependymal tissues. Heart: Moderate degree of fibrous tissue increase. Artery: Thickening of the walls involving mostly the media, to some extent proliferation of the intima. Lung: In portions typical tubercular nodules, varying in size and degree of degeneration, centrally other portions, intense vascular engorgement, and filling of the vesicles with blood, other portions dilatations of some of the vesicles with thinning of the walls, more or less engorgement of the alveolar capillaries, vesicles containing a few leucocytes, and epithelial cells, more or less perivascular, and peribronchial, pigmentary infiltration, proliferation of the bronchial mucous cells, some of the bronchioles filled with desquamated epithelial cells, and some leucocytes. Spleen: Intense engorgement, malpighian bodies large and dense, staining deeply. Liver: Scattered typical tubercular nodules, moderate degree of leucocytic and fibrous tissue increase in the portal fissures, tending to a strandlike arrangement, displacing or infiltrating the normal kidney structure, some diffuse fibrous tissue-increase in the medulla, and perivascular tissue. Moderate vascular engorgement.

200. Male. Age 52. First admission. Psychosis: Epileptic insanity. Reported restless, sleepless, profane, has delusions that the world is coming to an end, has ocular hallucinations. Is subject to epileptic convulsions.

Duration of psychosis: About seven years.

Cause of death: Asphyxia during a convulsion.

Clinical report: Admitted September, 1899, age 52, with a psychosis of epileptic insanity, dating back four months, prior to admission. No report given of his mental condition prior to the onset of the mental disturbance other than that he was subject to epilepsy. After admission the mental condition underwent a gradual and progressive development of dementia. Physically his health was good, except when it was disturbed by the epileptic seizures. Preceding and following the epileptic attacks he man-

ifested increased irritability, some clouding of consciousness, and at times outbreaks of violence. He was found dead in bed, face buried in pillow and lying upon the abdomen.

Pathological report: Pulmonary oedema, cicatricial contraction of the left apex, chronic bilateral pleuritic adhesions, congestion of bronchial mucosa, hyperplasia of the bronchial glands, cardiac hypertrophy, distension of the left heart, considerable epicardial fat, fatty infiltration of the right ventricle. Arterio-sclerosis and atheromatosis of the arteries. Moderate hydroperitoneum, chronic gastritis, adenoma of the ileum, chronic nephritis, atrophy of the left testicle, hyperplasia of the spleen, thyroid enlargement and cyst formation, persistent thymus, hyperplasia of the mesenteric glands, chronic leptomenigitis, subependymal ecchymosis in fourth ventricle, united fracture of the left tibia and fibula, general venous engorgement.

Microscopical report: Nerve cells: More or less chromatolysis, more so in the brain than in the cord, considerable vascular engorgement. Heart: Moderate degree of fibrous tissue increase in the left ventricle, and fatty infiltration of the right. Arteries: Diffuse irregular endarteritis, some thickening of the media, and foci of round cell accumulation in the external coat. Thyroid: Diffuse increase of fibrous tissue, dilatation of many of the vesicles, more or less infiltration of epithelial cells of the colloid content in the smaller vesicles. Lung: Intense engorgement of the alveolar capillaries, and of the blood vessels generally, most vesicles contain a few desquamated epithelial cells, others filled with blood, foci in which vesicles filled mostly with leucocytes, fibroid thickening of the pleura, and of the interlobular septa, perivascular pigmentary infiltration. Bronchial gland: Hyperplasia of the lymphfollicles fibrosis of the central part with more or less pigmentary infiltration. Spleen: Intense engorgement, decrease in number and size of the malpighian bodies. Liver: Intense engorgement, foci of round cell accumulation, in the portal fissures. Pancreas: Intense engorgement and diffuse increase in the fibrous tissue. Kidneys: Diffuse interstitial increase of fibrous tissue, foci of small round cell accumulation tubular epithelium shallow, lumen wide, content often granular.

202. Female. Age 55. First admission. Psychosis: Epileptic insanity. Reported excitable, destructive, violent and melancholic.

Duration of psychosis: Not known.

Cause of death: Asphyxia during convulsions.

Clinical report: Admitted in December, 1890. Age 55. No report of the physical or mental condition given prior to admission. At time of admission was in a condition of maniacal excitement, underwent rather rapid progressive dementia. Had an average of two attacks a day. Had several attacks of status, but recovered. Died while sitting in a chair during a convulsion.

Pathological report: Chronic myocarditis, extensive fatty infiltration of the heart, distention of the right heart with blood. Moderate arterio-sclerosis, moderate degree of chronic pleuritic

adhesions, cicatricial contraction of the apex of the right lung. Pulmonary anthracosis, hyperplasia of the bronchial glands, cirrhosis and fatty infiltration of the liver, chronic cholecystitis and pericholecystitis adhesions, cholelithiasis and partial occlusion of the common bile duct short distance from the union of the cystic and hepatic ducts. Cicatricial constriction of the appendix, chronic catharral appendicitis, carcinoma of the base of the appendix, carcinoma of the caecum, chronic gastritis, gastric adenoma, extensive chronic nephritis, senile atrophy of the ovaries, caseous degeneration of the left adrenal, hyperplasia of the mesenteric and retroperitoneal glands, chronic lepto- and pachy meningitis, cystic choroid plexus, chronic pancreatitis, united left Colles' fracture, oedema of the legs.

Microscopical report: Nerve tissue: Only slight chromatolysis of the cells of the cord, rather extensive of the cortex, central canal filled with proliferated epithelial cells. Heart: Extensive fatty infiltration of the right ventricle, some interstitial connective tissue increase. Aorta: Extensive endarteritic thickening. Bronchial glands: Foci of tubercular nodules. Lungs: Foci of round cells and a few epithelial cells filling of the vesicles. Spleen: More or less engorgement, malpighian bodies dense and prominent. Adrenal: Left intense engorgement, moderate diffuse round cell infiltration of the cortex, granular degeneration of the medulla. Pancreas: Increase of interstitial fibrous tissue. Liver: Extensive fatty infiltration in the periphery of the lobule involving the outer three-quarters of the lobule, in some cases almost the whole lobule, but few hepatic cells are visible, and they as a rule are small and deeply pigmented. Extensive thickening of capsule, more or less round cell accumulation in the deeper portions, extensive strandlike increase of the fibrous tissue and inflammatory cells between individual lobules and groups of lobules, at places proliferation of the bile duct. Kidneys: Engorgement of the blood vessels, extensive strandlike increase of fibrous tissue with foci of round cell infiltration in the cortex. Diffuse fibrous tissue increase in the medulla, tubular the epithelium shallow, lumen wide, some filled with granular or hyaline debris, Bowman's capsule of many glomeruli thickened, some assuming a more or less whorl-like arrangement. Stomach: Proliferation of the mucosa, hyperplasia of the lymphatic elements, mass of epithelial cell infiltration submucous connective tissue framework infiltration and taking the place of the normal tissue. Foci of round cell collection scattered through and around it. Caecum and appendix: Epithelial cell infiltration massed together in its superficial part, infiltrating the tissues in a more or less tubular manner, masses of round cell collections, hyperplasia of the lymphfollicles.

204. Female. Age 62. First admission. Psychosis: Epileptic insanity. Reported as maniacal and violent. Duration of psychosis: Not given. Cause of death: Asphyxia during a convulsion.

Clinical report: Admitted April, 1894, age 50, with a psychosis of epileptic mania. Married. Father intemperate. Sister deformed. Onset of convulsions twenty years ago, whenever she had a miscarriage. The periods of maniacal excitement occurred at each epileptic attack. Physical condition was good throughout. Was found dead in bed, lying on the back, one limb hanging out of the bed, face covered with frothy mucous and mouth filled with it.

Pathological report: Extensive pulmonary oedema, subpleural ecchymosis, chronic left pleuritic adhesions, congestion of the bronchial mucosa, hyperplasia, pigmentation, and caseation of the bronchial glands. Extensive cardiac hypertrophy sclerosis of the mitral valves, extensive fatty infiltration of the right ventricle, distention of the right auricle, general rather extensive arteriosclerosis, chronic perihepatic adhesions, cirrhosis of the liver, chronic nephritis, severe atrophy of the ovaries, cystic condition of the uterine cervix, hyperplasia of the spleen, cyst of the left lobe of the thyroid, chronic pachy- and lepto meningitis, moderate chronic external hydrocephalus, general cerebral atrophy, cystic choroid plexus, oedema of the legs.

Microscopical report: Nerve tissue: Chromatolysis of the cerebral cortex cells, central canal of the cord filled with epithelial cells. Heart: Extensive fibrous tissue increase, fatty infiltration of the right ventricle. Artery: Considerable endarteritic thickening, foci of granular and fatty degeneration, foci of small round cell collections in the external coat. Lung: Most vesicles filled with slightly granular material and some contain blood and a few epithelial cells. Bronchial glands: Hyperplasia of the follicles, diffuse pigmentation, foci of typical tubercular nodules. Thyroid: Dilatation of some of the vesicles. Spleen: Intense engorgement, malpighian bodies dense and prominent. Pancreas: Diffuse increase of the fibrous tissue most marked in the center of the lobule. Liver: Moderate engorgement, slight increase of fibrous tissue, with collections of round cells in many portal fissures. Kidney: Extensive thickening of the capsule, and the walls of the blood vessels involving mostly the middle coat, extensive diffuse increase of inflammatory fibrous tissue and cells. Engorgement of the blood vessels, tubules and glomeruli destroyed where the accumulations of fibrous tissue, several cystlike spaces due to dilation of tubules subcortical. Pineal gland and choroid plexus: Numerous concentric hyaline bodies.

206. Female. Age 34. First admission. Psychosis: Epileptic insanity. Reported as having outbreaks of violence, refusing to eat and to speak; sullen, confused in acts and ideas, loss of memory and incoherent in talk.

Duration of psychosis: Not given.

Cause of death: Hypostatic pneumonia in status.

Clinical report: Admitted in May, 1904. Age 32. Single. Has had epileptic attacks for several years; began to draw knives and revolvers on people, became sullen and at times confused and violent. Reported syphilitic. After admission rather quiet. Ir-

ritable and quarrelsome at times. General health good. Convulsions began June 11, 1906, and died June 13.

Pathological report: Extensive pulmonary hypostasis, nodular and cicatricial condition of both apices, most of the nodular caseous chronic bilateral pleuritic adhesions, congestion of the bronchial mucosa, hyperplasia, pigmentation and caseation of the bronchial glands, fatty infiltration of the right ventricle of the heart, moderate arterio-sclerosis, atheromatosis, chronic perihepatitis, chronic perispleenitis, syphilitic gumma of the liver, chronic nephritis, chronic pelvic peritonitis, cysts of the left broad ligament, chronic salpingitis, enlarged thyroid with cyst formation, chronic meningitis, general cerebral atrophy, several foci of yellowish softening in the posterior part of the optic thalamus and adjoining part of the lenticular nucleus, granular ependyma, persistent thymus, united broken nose, subcutaneous extravasation of blood beneath both eyes, extensive scarring of head and arms.

Microscopical report: Nerve tissue: Moderate chromatolysis of the cortical pyramidal cells, more or less vascular engorgement, perivascular spaces wide and prominent. Heart: Diffuse interstitial increase of fibrous tissue of the left ventricles, some thickening of the epicardium, some fatty infiltration of the right ventricle. Artery: Quite uniform, endarteritic proliferation of the intima; foci of round cell infiltration of the external coat. Lung: Extensive engorgement, extensive diffuse chronic infiltration with tubercular nodules and masses more or less degenerated in a granular debris centrally, more or less fibroid tissue formation; giant cells, epithelial cells, round cells and blackish pigmentation, areas of filling of the air vesicles with blood, walls of the blood vessels thickened, filling of the bronchioles with leucocytes, and desquamated epithelial cells, many of the bronchioles surrounded by tubercular masses. Bronchial gland: Intense engorgement, diffuse blackish pigmentation, hyperplasia of the cells in the follicles. Thyroid: Great irregularity in the size of the vesicles, and dilated colloid content of many of the smaller ones, more or less infiltrated with epithelial cells. Spleen: Intense engorgement, hyperplasia of the cells of the malpighian bodies. Kidneys: Intense engorgement, localized areas of slight interstitial fibrous tissue increase involving more particularly the periglomerular portions. Liver: Intense engorgement, extensive diffuse infiltration, with masses and nodules of round cells infiltrating between the individual liver cells and columns of cells, between the individual lobules and groups of lobules, wholly displacing the normal liver cells, more or less degenerating centrally into a granular appearing debris, surrounded by more or less fibrous tissue and cells, strands of fibrous tissue following more or less the course of the portal fissures more or less of increase at places of bile ducts: blood vessel walls more or less thickened, narrowing the lumen with occlusion of some.

207. Male. Age 53. First admission. Psychosis: Epileptic insanity. Reported maniacal, incoherent and irrational in conversation, and at times violent.

Duration of psychosis: Four years.

Cause of death: Hypostatic pneumonia with status.

Clinical report: Admitted September, 1903. Age 50. Occupation, laborer. In a condition of maniacal excitement. Epileptic convulsions said to have existed for six years. Onset of mental disturbance about one year before admission by periods of maniacal excitement following the epileptic attacks. Standing around forgetting everything; at times violent; at others stuporous and morose; imagines things that are not so and acts accordingly; serial convulsions existed two days before death.

Pathological report: Extensive hypoastatic pneumonia moderate left hydrothorax, collapse of the lower and posterior portion of the left lung, chronic extensive bilateral pleuritic adhesions, a few small calcareous nodules, centrally cheesy, diffused through the lungs. Congestion of the bronchial and tracheal mucosa, hyperplasia, pigmentation and sclerosis of the bronchial glands. Extensive cardiac hypertrophy, sclerosis of the mitral cusps, extensive fatty infiltration of the right ventricle, extensive arteriosclerosis, atheromatosis, and calcareous infiltration involving mostly the medium sized vessels, cholelithiasis, chronic pancreatitis, chronic gastro enteritis, extensive chronic nephritis, hyperplasia of the spleen, chronic pachy and leptomeningitis, moderate increase of cerebro-spinal fluid, general cerebral atrophy involving the left hemisphere most, slight dilatation of the cerebral ventricles, cystic choroid plexus, granular ependyma, united fracture of the fifth metacarpal bone of the hand, chronic ulceration of the thumb of the right hand, cicatricial contraction of the vermiform appendix.

Microscopical report: Nervous tissue: Chromatolysis, rather pronounced, perivascular and pericellular lymphspaces prominent, extensive endarteritic thickening of the walls of the blood vessels narrowing the lumen. Heart: Moderate degree of interstitial fibrous tissue increase, extensive fatty infiltration of the right ventricle, moderate thickening of the endocardium, round cell accumulation in its deeper portion. Artery: Extensive diffuse, irregular proliferation of the intima and some thickening of the media. Pituitary body: Engorged and some fibrous tissue increase. Liver: Intense engorgement. Pancreas: Increase of fibrous tissue. Adrenal: Foci of round cell infiltration most marked in the medullary portion. Thyroid: Colloid content of the smaller vesicles, more or less infiltrated with epithelial cells. Lung: Intense vascular engorgement, many of the vesicles filled with granular debris and a few leucocytes and epithelial cell masses in which vesicles are filled with blood, others with leucocytes and a few epithelial cells, thickening of the pleura, rather extensive perivascular and subdural blackish pigmentation. Kidney: Extensive thickening of the capsule, extensive diffuse fibrous tissue most marked subcapsular, extending in strandlike bands into the substance involving both the tubules and glomeruli, many glomeruli whorllike, capillaries engorged, blood vessel walls thickened, numerous foci of round cell accumulation, an

area of epithelial-like cell collection arranged more or less into an alveolar-like formation surrounded by a distinct fibrous capsule, sharply circumscribed, with a distinct fibrous tissue framework, alveoli are irregular in size and shape, and the cells resemble the cortical cells of the adrenals.

208. Female. Age 52. First admission. Psychosis: Epileptic insanity. Reported sleepless, violent, destructive and homicidal. Married seven years, no children. Insane three years before admission.

Duration of psychosis: Fourteen years.

Cause of death: Pulmonary tuberculosis.

Clinical report: Admitted February, 1895, with a psychosis of epileptical maniacal excitement, beginning three years before admission. Since admission the patient has become very much demented, scarcely uttering an intelligible word. Has had on an average two to three convulsions a day, and has been in status four to five times during the last five years. At times she was noisy and destructive, frequently requiring restraint on account of filthy habits, eating faeces and soiling clothing. During the last year the patient has been gradually declining, with cough and expectoration, continuous temperature running from 101 to 103 F., rapid pulse, tenderness on pressure over the abdomen, profuse semifluid stools which were extremely offensive in odor, resisting almost wholly medicinal remedies. Had no seizure during the last six weeks of illness.

Pathological report: Extensive diffuse nodular tuberculosis of the lungs with extensive cavity formation in both apices; chronic bronchitis, chronic pleuritic adhesions, completely obliterating the pleural cavity on the right side; hyperplasia, pigmentation and caseation of the bronchial glands; moderate arterio-sclerosis, slight fatty infiltration of the right ventricular wall, chronic peritoneal adhesions, ulcerative tubercular appendicitis, fatty infiltration of the liver, tuberculosis of the caecum, ascending colon and of the small intestine, hyperplasia of the spleen, enlargement of the thyroid gland, hyperplasia of the mesenteric and retroperitoneal lymphatic glands, uterine fibroid, moderate degree of chronic pachy and leptomeningitis, moderate excess of subdural and subarachnoid fluids, general cerebral atrophy, united fracture of the nose, cicatricial deformity of the right ear, decubital ulcer.

Microscopical report: Lung: Diffuse infiltration of the lung substance with typical nodules, varying in size, shape and degree of degeneration, thickening of some and thinning of other alveolar walls in the intervening tissue, engorgement of the capillaries, chronic inflammatory thickening of the pleura. Bronchi: Hyperplasia of the mucosal epithelium, completely filling the lumen of some; intense engorgement of the peribronchial vessels. Bronchial glands: Hyperplasia of the lymph nodules, diffuse pigmentary blackish infiltration, typical tubercular foci varying in size and degree of degeneration. Heart: Fibers small excess of perinuclear pigment. Artery: Moderate degree of endarteritic pro-

liferation of the intima. Thyroid gland: Extensive increase of fibrous tissue, vesicles small and mostly filled with desquamated epithelium, a circumscribed mass surrounded by a distinct fibrous capsule, body made of epithelial-like cells arranged more or less into alveoli, with a fibrous tissue framework carrying the blood vessels. Pituitary body: Increase of fibrous tissue, intense engorgement of the blood vessels. Spleen: Hyperplasia of the malpighian bodies, diffuse distribution of lymph corpuscles throughout the splenic substance. Pancreas: Slight diffuse increase of interstitial fibrous tissue. Liver: The liver cells are almost wholly displaced by fat globules, outline of the lobules indistinct; nuclei of the liver cells were visible, situated on the outer part of the cell, only a few liver cells visible in the central part of the lobule, scattered throughout the substance are a few foci of typical tubercular nodules. Kidney: Scattered foci of round cell infiltration through the cortex. The tubular epithelium is swollen, stains faintly, nuclei faint, slight increase of periglomerular fibrous tissue and glomerular nuclei.

213. Male. Age 56. First admission. Psychosis: Epileptic insanity. Reported melancholic, restless, sleepless, conversation incoherent, wanders about, not inclined to talk much, profane, intemperate, at times violent, threatening those about him.

Duration of psychosis: Fifteen years.

Cause of death: Acute dilatation of the right heart.

Clinical report: Admitted March, 1893. Age 44. Occupation carpenter. Addicted to the use of morphia: two or three uncles intemperate. Onset about two years before following an attack of la grippe. On admission was melancholy, restless, sleepless, incoherent in conversation, with outbreak of violence; after admission he underwent a gradual progressive dementia, with occasional periods of confusions accompanying the epileptic seizures. His physical health was fair. The epileptic seizures were of the grand mal type, occurring in groups of three or four, and at intervals of several months. Four months before he contracted a septic inflammation of the leg, which healed some time before death. On the morning before death he was taken with a severe epileptic seizure, and about noon with another, in which he died.

Pathological report: Extensive cardiac hypertrophy and dilatation of the right side and left auricle, sclerotic patches of the epicardium, extensive sclerosis of the mitral valves and contraction of the orifice, sclerosis of the aortic valves, moderate arterio-sclerosis and atheromatosis, chronic bilateral pleuritic adhesions, pulmonary oedema and beginning hypostasis, abscesses in the lower lobe of the right lung, cirrhosis of the liver, chronic gastritis, extensive chronic nephritis, hyperplasia of the spleen, slightly enlarged thyroid gland, hyperplasia and pigmentation of the bronchial glands, chronic bronchitis, extensive chronic pachy and leptomeningitis, excess of subdural fluid, general cerebral atrophy, excessive dilatation of the ventricles, ependyma granular throughout, enlargement of the pineal gland, deformity of the nose, excessive scar-

ring over the head and arms, chest and legs, opacity of the right lens.

Microscopical report: Nerve tissue: Slight chromatolysis, general engorgement of the blood vessels, thickening of the vessel walls, with narrowing of the lumen, pericellular and perivascular lymph spaces well marked, tendency to round cell accumulation in the latter, central canal in the cord filled with proliferated epithelial cells, proliferation of the ependymal cells. Pineal gland: Consists of epithelial-like cells arranged more or less into irregular alveoli by a fibrous tissue framework, contains numerous spherical and calcareous bodies. Gasserian ganglion and choroid plexus: Numerous concentric hyaline bodies. Heart: Fibroid thickening of the pericardium, foci of round cell infiltration in the deeper portion, moderate fatty infiltration of the right ventricle, moderate fibrous tissue increase in both ventricles. Artery: Extensive endarteritic proliferation of the intima, with more or less atheromatous degeneration. Lung: Fibroid thickening of the pleura, extensive subpleural blackish pigmentation, thickening of the walls of the blood vessels, extensive vascular engorgement, extensive diffuse increase of fibrous tissue, with intervening masses of dense round cell accumulation filling the spaces, many vesicles in the intervening lung tissue filled with blood. Thyroid gland: Slight increase of interstitial fibrous tissue, dilatation of some of the vesicles, colloid content of many of the vesicles more or less infiltrated with epithelial cells. Spleen: Intense engorgement, hyperplasia of the cells of the malpighian bodies, diffuse increase of the lymph content. Pancreas: Moderate increase of the interstitial fibrous tissue. Adrenals: Intense engorgement, foci of round cell accumulation scattered throughout the substance. Liver: Extensive increase of fibrous tissue, extending strandlike between the individual lobules and groups of lobules, with foci of dense round cell collections, mostly in the portal fissures, some increase in the bile ducts at places, some thickening in the walls of the bile duct and blood vessels. Kidney: Moderate diffuse fibrous tissue, increase at places, extending in bands from the capsule, many of the tubules dilated, and the epithelium shallow, many of the glomeruli more or less fibrous, general engorgement, thickening of the blood vessel walls.

GENERAL PARESIS.

180. Male. Age 56. First admission. Psychosis: General paresis. Reported despondent, intemperate, hypochondriacal, sleepless, irritable, greatly excited at times, felt that he would live to lose his mind, imagined physicians were trying to poison him, indulged in sexual excesses.

Duration of psychosis: About four years.

Cause of death: Exhaustion.

Clinical report: Admitted September, 1905. Occupation farmer.

One uncle and one cousin insane. One cousin epileptic. Reported

as having been affected by the sun at early life, and again two years ago. Used alcohol moderately until four years ago, after which he used it excessively. Married four times; one child said to have been hydrocephalic. Mental disturbances began four years ago by a period of despondency contemporaneous with hard drinking, stating at times that he would live to lose his mind. In May, 1905, he became irritable, inclined to excesses in manner and habits. Complained of pain and pressure in back of neck and head. In July the conditions became exaggerated. He talked continuously, somewhat incoherently, pertaining chiefly to business matters; asked for something to stop it, saying that he could not do it himself, and often held his hand over to stop it. Threatened to shoot himself if it could not be stopped. Later he imagined the doctors were trying to poison him. On admission he was greatly emaciated, had pronounced ataxia in station. Knee jerks faint, gait tremulous, speech thick, pupils unequal and irregular, reacted slightly to light, ophthalmoscopically showed a mild degree of optic neuritis. The condition became more and more exaggerated, paralysis of the sphincters supervened, also several decubitus and a constant struggling delirium until death from exhaustion.

Pathological report: Extreme emaciation, extensive sacral decubitus, assymetry of the ears, extensive general arterio-sclerosis, chronic pleuritic adhesions (right base and posterior surface, obliterating the cavity at that part), slight degree of pulmonary lobular emphysema, slight pulmonary hypostasis, diffuse haemorrhagic ecchymosis in the gastric mucosa, chronic nephritis, chronic splenitis, hyperplasia of the bronchial and mesenteric glands, chronic meningo-encephalitis, extensive chronic external and internal hydrocephalus. Extensive dilatation of the ventricles, ependyma granular throughout.

Microscopical report: The nerve cells show a more or less degree of chromatolysis and accumulation of the round cells in the perivascular spaces. In the heart there is a moderate degree of fibrous tissue increase. In the blood vessels the intima is rather thickened, narrowing the lumen proportionately, and the thickened part is more or less granular. The lungs show dilatation of some of the vesicles, with thinning of the walls. In other parts the vesicles are filled with more or less granular material, containing a few degenerated epithelial cells and leucocytes. The thyroid glands show moderate inequality in the size of the vesicles, and in the smaller ones the colloid material is becoming infiltrated with epithelial cells resembling those lining the vesicles. In the liver there is intense engorgement of the center of the lobule, dilatation of the intercellular spaces, atrophy and pigmentation of the hepatic cells. In the pancreas there is a moderate fibrous tissue increase. In the spleen apparent increase of trabecular formation and intense engorgement. In the kidneys a rather extensive increase of inflammatory tissue more or less diffused, localized areas forming dense masses of small, round

cells and fibrous tissue. Many of the tubules are dilated, some filled with granular debris, the cells shallow and ragged. The blood vessel walls are thickened. The capillaries are intensely engorged.

181. Male. Age 47. Negro. Second admission. Psychosis: General paresis. Reported as imagining himself as possessed of great wealth and many influential friends, extremely violent and dangerous to himself and surroundings.

Duration of psychosis: Two and one-half years.

Cause of death: Pulmonary oedema.

Clinical report: First admission May, 1903, age 47, with a psychosis of general paresis. Improved and was discharged August, 1903. Readmitted January, 1905, in a condition of acute maniacal excitement, beginning about one week before admission, with delusions of wealth, no idea of his whereabouts, loss of memory, violent and destructive. Physically he was very weak from maniacal exhaustion. There was some improvement, but slow and gradual. In the forenoon the day preceding death he was taken with an epileptoid convulsion, from which he promptly recovered. The following day he had another convulsion, which passed rapidly into coma and death.

Pathological report: Extensive pulmonary oedema, firm bilateral pleuritic adhesions, slight epicardial sclerosis, extensive cardiac hypertrophy, sclerosis of the mitral and aortic cusps, some fatty infiltration of the ventricular wall, extensive arterio-sclerosis and atheromatosis of the arteries, extensive parenchymatous nephritis, enlarged middle lobe of the prostate. Haemorrhagic extravasation into the spleen, hyperplasia of the mesenteric glands, slight leptomeningitis, moderate increase of subarachnoidean fluid, atrophy of the frontal convolutions, dilatation of the ventricles.

Microscopical report: Nerve cells stain diffusely with Nissl's stain and show more or less chromatolysis with H. and E.; there is extensive small, round cell accumulation in the arachno-pia, most marked about the blood vessels; many of the vessels entering the cortex are apparently plugged with cells, the perivascular spaces throughout the cortex more or less filled and distended with leucocytes. Engorgement of the blood vessels. In the pituitary body intense engorgement. In the heart moderate strandlike fibrous tissue increase, most marked in the deeper portion, slight fatty infiltration of the superficial part of the right ventricle. Arteries: Extensive endarteritic thickening of the intima, more or less granular diffuse foci of round cell collection in the outer coat. Lung: Some vesicles dilated, walls thinned, engorgement of the alveolar capillaries, some contain a few desquamated epithelial cells or a few leucocytes, some blood, some homogeneous material plus a few epithelial cells. Spleen: Relative increase in trabecular content, malpighian bodies, small diffuse dissemination of the lymph cells, foci of accumulation of blood. Liver: Dilatation of the intercellular spaces in the center of the lobule, spaces with blood, corresponding hepatic cells small, slight fibrous

tissue increase in some of the portal fissures. **Kidneys:** Intense engorgement, blood vessels thickened, extensive increase of inflammatory fibrous tissue and accumulation of inflammatory corpuscles, extending strandlike from the capsule inward, also collected into masses scattered through the kidney substances. Epithelium of many tubules shallow, lumen wide, a few containing hyaline and granular contents, many of the glomerular walls thickened.

194. Male. 48. Second admission. Psychosis: Rec. mania. Reported as excited, sleepless, claims to see unearthly things, thinks his brothers are persecuting him.

Duration of psychosis: Eight years from second admission.

Cause of death: Right lobar pneumonia (tubercular).

Clinical report: First admission 1895, with a psychosis of mania. Second admission 1898, with hallucinations of sight, delusions of persecution, wealth, and claimed that he was God. Physically health was fairly good on admission, but soon began to decline; lost strength and weight, and appetite to refusal of food. Several months before death cough developed, and he complained of pain in the chest. About forty-eight hours before death symptoms of pneumonia developed and continued until death. Patient had a severe attack of typhoid fever about one year before first mental trouble.

Pathological report: Pneumonia consolidation of the lower posterior portion of the middle and posterior baso portion of the upper lobes of the right lung. Several areas of gangrenous softening in the lower lobe, pleura reddened and granular, tubercular nodules, some are more or less caseated and varying in size in the apices of the upper lobes of both sides, chronic bilateral pleuritic adhesions, tubercular bronchial glands. Slight arteriosclerosis involving the coronary orifices, patent foramen ovale, chronic perihepatic adhesions, chronic nephritis, chronic pachy and leptomenigitis. Increase of subdural fluid, general cerebral atrophy, slight chronic internal hydrocephalus, granular ependyma of the fourth ventricle, central canal of the spinal cord in the lumbar region dilated, subacute bronchitis.

Microscopical report: Sympathetic and spinal ganglia stain diffusely, cells irregular in shape, nucleus in many cells situated laterally, and protoplasm of many contain yellowish pigment. The cells of the superior horn of the spinal cord of the cerebral cortex of the Purkinje show well marked chromatolysis. The central canal of the spinal canal is enlarged in the lumbar region, and is triangular in shape, proliferated epithelial cells infiltrate the surrounding tissue. In the dorsal and cervical region proliferation of the lining epithelium completely fills the canal. Lung: In the pneumonia portion vesicles mostly filled with red blood cells, leucocytes, some epithelial cells and some fibrinous threads. Many are filled chiefly by leucocytes, the nodular portion show diffuse foci of consolidation usually peribronchial, centrally degenerated into a granular debris surrounded by a cellular zone containing

giant cells. The alveolar walls elsewhere show either thinning or engorgement. There is considerable blackish pigmentary infiltration peribronchially and perivascularly. The bronchial glands are diffusely infiltrated with typical tubercular nodules varying in size, centrally more or less degenerated. Heart shows diffuse fibrous tissue increase, most marked perivascularly, slight fatty infiltration of the right ventricle, thickening of the blood vessel walls, the arteries show thickening of the intima, which appears more or less granular, and also a thickening of the media. In the liver the cellular spaces are dilated, filled with blood, the hepatic cells small and pigmented in the center of the lobules; in the periphery there is occasionally slight fatty infiltration. The adrenals are intensely engorged and the blood vessels thickened. Spleen engorged. Kidneys are engorged, irregularly diffused, fibrous tissue and inflammatory cellular increase, accumulation into dense masses, at places wholly displacing the normal kidney structure, most marked in the subcapsular portions. In other parts many tubules small and filled by the lining cells, in others dilated and epithelium shallow. Many glomeruli represented by a fibroid whorl. Blood vessels throughout thickened.

196. Male. Age 41. First admission. Psychosis: General paresis. Reported as acutely depressed, restless, incoherent, imagines that he had committed a crime, fears of starvation.

Duration of psychosis: Five years.

Cause of death: Convulsions.

Clinical report: Admitted October, 1901, age 37, with a psychosis of acute melancholia beginning four months previous. Imagined that he had committed a crime. Feared he would starve; was pursued by some one to do him bodily harm; that his own health was entirely lost; imagined that his wife was insane, etc. He gradually became worse, destructive, filthy, subject to outbreaks of violence, speech defect became pronounced, manifested increasing and progressing dementia. In February, 1901, he received an injury to the head that rendered him unconscious and after which he always complained physically. In January, 1906, a right hemiplegia developed, which gradually subsided. He died in a convulsive seizure.

Pathological report: Slight sclerosis of the body of the mitral and aortic valves. Dilatation of the right side of the heart. Extensive sclerosis and atheroma of the arteries, right coronary orifice almost occluded, beginning pneumonia of the lower lobe and base of the upper lobe of the right lung, fatty infiltration of the liver, increased compactness of the cranial bones. Chronic pachymeningitis, extensive leptomenigitis, chronic external hydrocephalus, general atrophy of the brain, left hemisphere more than the right, ventricles dilated, the left lateral extensively so, ependyma granular throughout.

Microscopical report: Nissl stain of the nerve tissue shows extensive chromatolysis, H. and E. capillary engorgement, perivascular

spaces more or less filled with round cells, completely plugging some of the medium sized vessels, walls of the blood vessels thickened, involving mostly the intima and media. In the heart the same involvement of the blood vessel walls, fatty infiltration of the right ventricle walls and a fibroid appearance of the papillary muscles. In the lungs dilatation of some of the vesicles, with thinning and rupture of some of the walls. In other portions there is filling of the alveoli, with collection of cells, mostly leucocytes, also extensive blackish pigmentary perivascular infiltration. In the kidneys there is extensive diffuse increase of inflammatory masses of round cells and fibrous tissue, most marked in the medullary and subcapsular portion, entirely displacing the renal structures at places, involving more or less the tubules and glomeruli; the remaining organs show more or less congestion, and the walls of the blood vessels are thickened and the lumen more or less narrowed.

203. Male. Age 28. Single. Occupation, carbuilder. First admission. Psychosis: Paresis. Reported as talking incoherently; imagined that he possessed great wealth; was king of the clouds, constantly communicating with the Almighty; was being persecuted and was subject to outbreaks of violence.

Duration of psychosis: Not given.

Cause of death: Lobar pneumonia and pulmonary oedema.

Clinical report: Age 28. Admitted in June, 1905, with a psychosis of general paresis. Was very weak and almost helpless, was in a more or less maniacal condition physically, gradually and rapidly becoming weaker, developing stupor, coma and symptoms of pneumonia. Reported as having a fracture of the skull six years ago, from which he apparently completely recovered in about two weeks.

Pathological report: Moderate pulmonary oedema, pneumonic condition of the lower lobe of the left lung, moderate degree of fatty cirrhosis of the liver, submucous gastric ecchymosis, swollen appearance of the heart, spleen and kidneys. Depression of the skull about 5 cm. over the left parietal bone, above the mastoid process, amounting to about 5 mm. in depth, cranial bones compact, contain few diploe, moderate dural adhesions, moderate meningitis, depression over the left temporosphenoidal lobe corresponding to the depression in the skull. Right posterior communicating artery partly taking the place of the posterior cerebral, absence of the right eye, atrophy of the right optic nerve and partly of the commissure and tract, amputation of the tip of left thumb, general enlargement of the lymphatic glands.

Microscopical report: Nissl stain shows rather an extensive degree of chromatolysis, H. and E. capillary enlargement of the cerebral and cerebellar cortex, central canal of the spinal cord filled with epithelial cells. Immense enlargement of the pituitary body and of the stomach and the intestines. In the thyroid the colloid material of most of the smaller vesicles is becoming more or less infiltrated with epithelial cells, many of the vesicles being

filled with them. In the heart there are dense strands of fibrous tissue, slight fatty infiltration of the right ventricle, small size of the muscle fibers, with irregularity in the shape and size of the nuclei and thickening of the walls of the blood vessels. The lungs of the pneumonic portion show the vesicles filled with red blood cells and a few white and epithelial cells, in the other portions the vesicles containing a few leucocytes and epithelial cells and scattered small foci in which the vesicles are filled by leucocytes and a few epithelial cells; the alveolar capillaries are more or less engorged throughout. In the spleen there is rather extensive hyperplasia of the lymph follicles. In the liver a moderate increase of interstitial connective tissue in the portal fissures. In the pancreas there is some increase of interstitial connective tissue. In the kidneys intense engorgement, thickening of the blood vessels, slight interstitial connective tissue increase, most marked in the medullary portion and the perivascular area in the cortex.

210. Male. Age 41. First admission. Occupation, baker. Psychosis: Acute melancholia. Reported as melancholy, restless, sleepless, talking incoherently, walking constantly about the room, said there was something in his head, imagined some one was after him, has the general appearance of apathy, hallucinations of hearing, change of character.

Duration of psychosis: Ten months.

Cause of death: Pneumonia.

Clinical report: Admitted November, 1904, age 41, with a psychosis of acute melancholia, beginning three months before. After admission there was a progressive failure of the mental faculties, leading to complete dementia and helplessness. Physically on admission there was general weakness and emaciation, coarse tremor of the mouth and face, defective speech, pupils nonreactive to light, dementia rapid, and progressive impairment of the rectal and vesical sphincters, several days before death marked cyanosis and dyspnoea.

Pathological report: Bilateral pneumonia involving the lower lobe of the left side and the lower lobe and base on the right side. Acute bronchitis, hyperplasia, pigmentation and caseation of the bronchial glands, chronic pleuritic adhesions, cardiac hypertrophy, extensive arteriosclerosis, atheromatosis, ulcers and endarterial vegetations, chronic gastritis, chronic nephritis, hyperplasia of the mesenteric glands, moderate pachy and leptomeningitis, chronic external hydrocephalus, cystlike subarachnoid accumulation, general cerebral atrophy, slight dilatation of the ventricles, granular ependymitis, foci of softening in the optic thalami, left lumbar scoliosis, sacral decubitus.

Microscopical report: Nerve cells stain diffuse with Nissl's stain, H. and E. Cord: Central canal in lumbar region filled with desquamated epithelial cells, which also infiltrate the central gelatinous substance. In the cerebrum the pia is thickened by accumulation of the round, small cells, mostly about the blood ves-

sels. In the cortex the perivascular spaces are more or less filled with small, round cells, most marked in the parietal lobe. In the heart extensive strandlike increase of fibrous tissue and atrophy of the muscle fibers, the blood vessels throughout show extensive endarteritis. The thyroid gland vesicles are somewhat irregular in size and the small ones more or less infiltrated with desquamated epithelial cells, also show moderate increase of interstitial connective tissue. The pineal gland consists of epithelial-like cells more or less alveolated, and contains numerous irregular or concentric hyaline bodies. The choroid plexus contains many hyaline concentric bodies. Spleen shows intense engorgement and hyperplasia of the malpighian bodies. Liver intense engorgement, dilating and filling the intercellular spaces in the center of the lobules, the hepatic cells being small and deeply pigmented. Kidneys: Moderate increase of inflammatory fibrous tissue and cells more or less diffused in the medullary portion, focally distributed and more or less strandlike in the cortex, extending from the capsule inward with the base toward the periphery. Lungs: Areas in which the vesicles are mostly filled with leucocytes and some epithelial cells, other areas with vesicles filled with blood cells, some leucocytes and a few epithelial cells, others with some granular debris, alveolar capillaries more or less engorged. Bronchioles filled with desquamated epithelial cells, the surrounding blood vessels intensely engorged. The bronchioles are mostly surrounded by the areas of pneumonic consolidation. There is considerable perivascular pigmentation.

TABO-PARESIS.

211. Female. Age 36. First admission. Psychosis: Tabo-paresis. Reported melancholic, sleepless, emotional, ideal of persecution and grandiose ideas of wealth, absence of knee jerks, Argyll Robertson's pupil, scanning speech.

Duration of psychosis: Two and one-half years.

Cause of death: Exhaustion.

Clinical report: Admitted August, 1905. Age 34. Disturbance began about one and one-half years before admission. Neglectful of her household duties, restless, sleepless, melancholic and emotional. Later delusions of persecution and of wealth. After admission gradual and progressive deterioration. Mentally as a rule cheerful, subject to outbreaks of violence and abusive to those about her. A left hemiplegia developed, trophic disturbances and pronounced difficulties in speech, later loss of control of sphincters, involuntary passing of faeces and urine. The day before death she lapsed into a comatose state with fibrillary twitching of the muscles of the left side of face and body.

Pathological report: Cranial bones compact, extensive chronic hydrocephalus. Excess of subarachnoid fluid, forming cystlike collection over the left frontal lobe; at places general cerebral atrophy, extensive dilatation of the ventricles, granular ependyma,

posterior columns of cord gray, most marked in the lumbar region, cardiac dilatation, fragmentary appearance of the heart muscle, extensive arterial atheromatosis, cirrhosis of the liver, transverse colon caecum and most of the small intestine lying in the pelvic cavity. Extensive chronic nephritis, retro displacement of the uterus, chronic splenitis, hyperplasia of the bronchial and mesenteric glands, sacral decubitus.

Microscopical report: Nissl stain, cord cells of the anterior horn slightly irregular in shape, branches fairly numerous, Nissl bodies regular, nucleolus distinct, in cerebrum distinct chromatolysis. H. and E. central canal of the cord filled with desquamated epithelial cells, central gelatinous substance more or less infiltrated by them. In the cerebral cortex the pia thickened by accumulation of round cells more or less diffusely distributed, but more marked about the blood vessels. Many of the vessels that enter the cortex are completely filled with leucocytes, many perivascular spaces are dilated and filled with leucocytes, and all of them more or less so. Arteries in all organs thickened, most marked in the brain and kidneys, thickening of the walls due to endarteritis and increase of the media. In the heart extensive fatty infiltration of the walls of the right ventricle. In the lungs many vesicles are dilated and part of the alveolar walls thinned, many vesicles contain granular debris, a few leucocytes and desquamated epithelial cells, and occasionally a few red blood cells; alveolar capillaries are engorged, perivascular tissues infiltrated with blackish pigment, bronchioles filled with desquamated epithelial cells and a few leucocytes. In the thyroid moderate increase of interstitial connective tissue and infiltration of the colloid content of many of the smaller vesicles. In the pancreas moderate increase of the interstitial connective tissue. In the spleen thickening of the capsule, increase of trabecular formation, dense malpighian bodies. In the liver rather extensive strandlike increase of fibrous tissue, running between the individual lobules and groups of lobules, and distinct yellowish pigmentation of the cells in the center of the lobule. In the kidney thickening of the capsule, moderate degree of strandlike bands of fibrous tissue, extending from the capsule inward, many of the convoluted tubules almost completely filled by the lining cells, capsule of many glomeruli thickened, some glomeruli becoming converted into a whorllike structure, capillaries throughout engorged.

CHRONIC PARANOIA.

219. Male. Age 41. First admission. Psychosis: Chronic paranoia. Reported paranoiac with delusions of estates in Europe, ranches in the west, going to marry the President's daughter, descended from a noble family, etc., beginning two years and continuing until death.

Duration of psychosis: About two and one-half years.

Cause of death: Gastric carcinoma.

Clinical report: Admitted August, 1906. Age 41. Mental condition prior to onset of present illness not known. At time of admission had delusions of grandeur and of persecution, which continued until death. Physically his previous health was poor, due to chronic rheumatic illness, which led to ankylosis of all the joints in the lower extremities. Before admission he had undergone operation successfully for the straightening of the ankylosed joints of the right hip and knee. The left leg was bent on the thigh and the thigh on the abdomen in an ankylosed condition. In addition to the joint affection there was hypertrophy of the heart, polyuria with hyaline casts. In the winter of 1904 and 1905 there was evidence of pulmonary tuberculosis, which disappeared. Six months before death there developed subacute gastritis, epigastric tenderness, anorexia, vomiting of large quantities of turbid reddish fluid containing blood, and evidence of pyloric obstruction and great pain. Later this was relieved and followed by enteric stools, passing into uncontrollable diarrhea, intermittent vomiting, emaciation, cachexia, palpable tumor, anasarca gradually developed. Blood examination gave the characters of secondary anemia; stomach examination gave absence of free HCl, much mucous, traces of lactic acid. Urinary examination gave traces of albumin and hyaline casts.

Pathological report: Extensive emaciation, anasarca over the lower limbs, operation cicatrix over the outer side of the right hip and knee, these corresponding joints ankylosed in the extended position, ankylosis of the left knee, moderate hydropericardium, cardiac atrophy, moderate arteriosclerosis and atheromatosis, complete obliteration of the left pleural cavity by firm adhesions, a chondro-osseous mass, crescent shaped, about 18 cm. long, $\frac{3}{4}$ cm. wide, 2 cm. thick, between the two layers of the pleura lying over the outer surface of the lower lobe of the lung. Partial collapse of the left lung, apical lobular emphysema of the left lung, chronic bronchitis, hyperplasia and pigmentation of the bronchial glands, cirrhosis of the liver, papillomatous ulcerating mass, 8x3, occupying the posterior and inferior surface of the pyloric end of the stomach, infiltrating all the coats and just beginning to ulcerate through the peritoneal coat; chronic gastritis, chronic nephritis, hyperplasia of the gastrosplenic and retroperitoneal glands, chronic meningitis.

Microscopical report. Nerve tissue: Extensive chromatolysis, perivascular spaces prominent, central canal of the cord filled with epithelial cells, infiltration of the central gelatinous substance. Heart: Moderate degree of fatty infiltration, some fibrous tissue increase, areas of pericardial thickening, fibrous superficially round cells in the deeper portions. Artery: Slight endarteritis, proliferation of the intima, some hyperplasia of the media. Lung: Considerable fibroid thickening of the pleura, dilatation of many vesicles, with thinning and rupture of some of the walls, some perivascular blackish pigmentary infiltration. Thyroid: Exten-

sive increase of fibrous tissue, more or less diffuse, many vesicles dilated with some tendency of cyst formation, smaller vesicles more or less infiltrated with epithelial cells. Pituitary body: Increase of fibrous tissue, several cystlike spaces. Intestines: Proliferation and destruction of the superficial part of the mucosal epithelium at places, diffuse infiltration of the submucosa with round cells and some fibrous tissue increase. Pancreas: Moderate increase of fibrous tissue into and between the lobules. Spleen: Malpighian bodies small, diffuse infiltration with lymph corpuscles, walls of the blood vessels extensively thickened. Liver: Moderate engorgement, liver cells small. Kidney: Extensive diffuse increase of interstitial fibrous tissue glomeruli, small fibroid, increase in nuclear content, many more or less whorllike, some tubules contain granular and hyaline material, walls of the blood vessels extensively thickened. Stomach: Diffuse mass of epithelial cells infiltrating and taking the place of the normal structure, at the periphery areas of dense round cell infiltration, and some fibrous tissue, epithelial cells tending to assume an alveolar arrangement at others, infiltrating the tissue more or less in columns. Bronchi: Proliferation of the mucosal epithelium peribronchial round cell infiltration of masses of typical tubercle formations, centrally degenerated, more or less fibroid in the periphery, with numerous giant cells.

SENILE DEMENTIA.

184. Male. Age 77. First admission. Psychosis: Senile paranoia. Reported as a well systematized paranoiac with moderate increase of psychomotor activity, egotism, violent, destructive, homicidal, made repeated threats to take his wife's life, refused to eat food prepared by her, writes letters to the President and other national individuals.

Duration of psychosis: Not given.

Cause of death: Chronic myocarditis.

Clinical report: Admitted November, 1905, with a psychosis of a well-defined systematized paranoia. After admission he became somewhat quieter, but retained the paranoid delusions. His physical condition was that of general senile debility, considerable cardiac arrhythmia, slight dyspnoea, oedema of the ankles. After admission his general health improved, dyspnoea lessened. About 3 a. m. December, 1905, he arose to urinate, and while doing so fell forward, striking his head against the bed, inflicting a small cut on the right side of the forehead, partially through the scalp, about 1 cm. long.

Pathological report: Some epicardial sclerosis, dilatation of the right side of the heart, extensive cardiac hypertrophy, sclerosis of the mitral valves, moderate arteriosclerosis and atheromatosis, dilatation of the aorta, fatty infiltration of the right ventricle, chronic myocarditis, chronic bilateral pleuritic adhesions, calcareous and cheesy nodules in the apices of both lungs. Cirrhosis

of the liver, carcinoma of the stomach, chronic nephritis, hypertrophy of the prostate, secondary carcinomatous infiltration of the lymphatic glands surrounding the pyloric end of the stomach, cranial bones compact, extensive pleuritic adhesions, chronic pachy and leptomenigitis, increase of subdural and subarachnoidean fluid, general cerebral atrophy, sclerosis of the right occipital lobe, dilatation of the ventricles, cystic choroid plexus, cataract of both eyes.

Microscopical report: Nerve tissue: Moderate chromatolysis, central canal of the cord filled with epithelial cells, which also infiltrate more or less the central gelatinous substance, walls of the blood vessels thickened, involving mostly the middle coat. Gas-serian ganglion: Numerous concentric bodies, foci of round cell infiltration. Pituitary body: Considerable engorgement, several cysticlike spaces at the junction of the two portions. Heart: Moderate degree of diffuse interstitial fibrous tissue increase, extending between the individual fibers and groups of fibers, most marked in the deeper portions. Artery: In the large arteries extensive endarteritis, degeneration of areas in its deeper layers, moderate thickening of the middle and external coat. In the middle sized vessels the involvement of the middle and external coat predominates. Lungs: Proliferation of the bronchial epithelium, more or less filling up the lumen, some round cell infiltration, the intervening vesicles somewhat dilated and portions of the alveolar walls thinned, considerable perivascular and peribronchial blackish infiltration. Bronchial glands: Hyperplasia of the lymph follicles, extensive diffuse black pigmentation, foci of typical tubercle formation. Spleen: Intense engorgement, malpighian bodies dense and prominent. Liver: Intense engorgement, dilatation of the intercellular spaces, liver cells small and atrophic, those in the center of the lobule deeply pigmented, slight diffuse increase of fibrous tissue in the portal fissures, capsule thickened, strands of bandlike fibrous tissue extending into the liver substance. Kidney: Extensive diffuse fibrous tissue increase, forming dense masses with more or less cellular formation, entirely displacing the normal kidney tissue, at places Bowman's capsule of most of the glomeruli thickened, many of the glomeruli represented by a small cluster of capillaries or by the fibroid whorl, the epithelium of many tubules almost wholly destroyed, in others the epithelium is shallow and the lumen filled with more or less debris, some filled with hyaline bodies, considerable vascular engorgement, extensive thickening of the vascular walls, affecting the middle and external coats most. Lymph glands: Hyperplasia of the lymph follicles, masses of epithelial tissue arranged more or less into alveoli with a fibrous tissue framework. Stomach: Mass of epithelial cells more or less alveolated with a fibrous tissue framework, cells infiltrating the surrounding coats of the stomach, superficially the cells are more or less degenerated.

SECONDARY DEMENTIA.

193. Female. Age 55. First admission. Psychosis: Secondary dementia. Reported on admission very noisy, excitable, violent, destructive and homicidal, said to have had similar attacks two years before admission.

Duration of psychosis: About twenty-three years.

Cause of death: Cerebral hemorrhagic cysts.

Clinical report: Admitted April, 1889, with psychosis of acute mania. Nothing is reported of her previous condition. The course after admission was one of gradual increasing dementia, with an absolute loss of all mentality during the past four years. Two years before death the patient had a transient attack of hemiplegia. Since then there have been about six similar attacks, all lasting from forty-eight hours to four months, with entire recovery therefrom. The last attack was in October, 1905, from which recovery did not take place. There was loss of motion and of sensation, so far as could be ascertained, on the whole right side. There were repeated convulsive seizures, reported as being general, but usually beginning on the right side of the body. Pupils were generally dilated, the left smaller than the right, tongue deviated to the left, impairment of deglutition, right patellar reflex exaggerated, left normal. No ankle clonus. No Babinski reaction.

Pathological report: Extensive decubitus, atrophy of the muscles of the right arm and leg, right arm and leg is in a condition of flexure, distension of right auricle, dilatation of the aorta, extensive arterio-sclerosis and atheromatosis, localized pulmonary tuberculosis, chronic nephritis, senile atrophy of the liver, spleen and ovaries, slight meningitis, cerebral atrophy, left cerebral hemorrhagic cyst involving the posterior part of the third frontal convolution, the lower part of the ascending frontal the ascending parietal, the anterior inferior portion of the supramarginal, the anterior superior part of the temporo-sphenoidal convolutions and the island of Reil, hyperplasia of the bronchial glands.

Microscopical report: Nerve tissue: Extensive chromatolysis. Heart: Atrophy of the muscle fibres, slight increase of fibrous tissue. Artery: Extensive endarteritic proliferation of the intima, some thickening of the media and adventitia, irregular atheromatous degenerations of the deeper portions of the thickened intima. Lung: Diffuse, irregular, typical tubercular foci in all stages of degeneration, surrounded more or less by a pneumonic infiltration of the vesicles, fibroid thickening of the pleura, other portions negative. Bronchial glands: Hyperplasia of the lymph follicles, foci of typical tubercle formation, moderate diffuse blackish pigmentary infiltration. Ileum: Hyperplasia of the lymph follicles. Adrenal: Foci of round cell infiltration of the medullary portion. Spleen: Malpighian bodies very small and irregular, walls of the blood vessels extensively thickened, some almost occluded. Liver: Moderate engorgement, central

cells of the lobule atrophied and more or less pigmented, some increase of fibrous tissue and round cell collections, some bile duct proliferation, foci of fatty necrosis of the liver cells. Kidney: Some thickening of the capsule, moderate diffuse increase of fibrous tissue, most marked in the subcapsular and medullary zones, many of the glomeruli shrunken, tubular epithelium granular, walls of the arteries thickened, considerable vascular engorgement.

198. Male. Age 48. First admission. Psychosis: Secondary dementia. Reported melancholic, violent, homicidal, dangerous, attempt at suicide, rarely speaks, refuses to walk, at times noisy, excitable and irritable.

Duration of psychosis: About twenty-five years.

Cause of death: General peritonitis.

Clinical report: Admitted September, 1890. Age 32. Single. Laborer. Onset began about January, 1883, at age of 23. Was admitted September, 1890, with a psychosis of chronic mania. After admission was noisy, vulgar, abusive, easily angered, refused to walk, underwent gradual dementia. April 12, 1906, refused to get up, complained of pain in groin and abdomen, sick at stomach, followed by stercoraceous vomiting, legs flexed on the abdomen, and complained of intense pain when laying upon his back.

Pathological report: Haemoperitoneum, acute septic peritonitis, some chronic peritonitis, adhesions, chronic perihepatitis, acute perforative appendicitis, acute cystitis, perforating ulcer of the anterior walls of the bladder, chronic nephritis, chronic bilateral adhesions, hypostatic pneumonia, congestion of the bronchial mucosa, hyperplasia of the bronchial glands, also of the mesenteric and retroperitoneal glands, dilatation of the right side of the heart, some sclerosis of the aortic valve, moderate general arterio-sclerosis, united fracture of the right eighth costocartilagenous junction, cranial bones compact, slight leptomeningitis, increase of subarachnoidean fluid, general cerebral atrophy, foci of cortical softening.

Microscopical report: Nerve tissue more or less chromatolytic. Heart: Considerable fatty infiltration, some increase of interstitial fibrous tissue. Artery: Some endarteritic proliferation of the intima. Lung: Extensive engorgement of the capillaries, some of them ruptured, filling the vesicles with blood, other vesicles filled with leucocytes and desquamated epithelial cells. Pituitary body: Considerable engorgement. Choroidplexus: Numerous concentric hyaline bodies. Pineal gland: Numerous spherical and calcareous bodies. Spleen: Malpighian bodies dense, relative increase in trabeculae. Liver: Moderate fibroid thickening of the capsule, diffuse round cell infiltration of the subscapular zone. Considerable engorgement of the central zones of the lobules, atrophy and pigmentation of the liver cells. Kidneys: Extensive thickening of the capsule, bands of inflammatory tissue extending into the kidney substance, more or less diffused, but localized areas of dense fibroid structure, the lat-

ter taking the place of the kidney substance, many of the glomeruli are small, nuclei are apparently increased, some are whorl-like, walls of the blood vessels are thickened, moderate vascular engorgement. Omentum: Intensely vascular foci of round cell infiltration. Bladder: Proliferation of the mucosal epithelium, swollen homogeneous appearance of the normal tissue, more or less round cell infiltration and vascular engorgement.

201. Female. Age 32. First admission. Psychosis: Secondary dementia. Reported as a profoundly acute melancholic with loss of interest in self and surroundings, beginning six months before admission.

Duration of psychosis: Two years.

Cause of death: Pulmonary and intestinal tuberculosis.

Clinical report: Admitted September, 1904, with a psychosis of acute melancholia beginning six months before admission. After admission the depressed state continued until September, 1905, when she became acutely maniacal, which was followed by a gradual progressive dementia. Physically on admission there was evidence of pulmonary tuberculosis, which was reported as beginning about one year before admission. In March, 1906, bowel trouble appeared with severe diarrhea which could not be controlled by medication. For three months the course was rapidly progressive downwards, cough, high temperature, rapid pulse, profuse expectoration and diarrhea, at times containing blood, rapid respiration, dullness on percussion, over both lungs with areas of tympanic resonance over the upper portion of the left lung anteriorly, numerous vesicular murmurs, bubbling rales distributed throughout, broncho-cavernous breathing associated with gurgling rales over the cavity.

Pathological report: Slight hydropericardium, cardiac atrophy, slight sclerosis of the mitral valves, moderate arterio-sclerosis, chronic pleuritic adhesions, extensive ulcerative pulmonary tuberculosis with cavity formation, hyperplasia of the bronchial glands, chronic peritonitis, pyoperitoneum, chronic perihepatitis double pyosalpinx, chronic nephritis, tubercular ulcerations of the caecum, ascending colon, appendix and small intestine, chronic pelvic peritonitis double pyosalpinx, atrophy of the thyroid gland, hyperplasia of the mesenteric and retroperitoneal glands, cranial bones cancellous, chronic pachy and leptomeningitis, increase of subdural fluid, cystic choroid plexus, cerebral atrophy.

Microscopical report: Nerve tissue: More or less chromatolysis. Heart: Moderate degree of interstitial fibrous tissue increase, fibres small and atrophic. Lung: Extensive diffusely scattered foci, miliary to nodule size of typical tubercle formation in all stages of degeneration, some tending to fibrosis, extensive blackish infiltration of the peri-degenerated area. The intervening vesicles irregular, some alveolar walls thinned, others thickened, more or less epithelial desquamation. Bronchial glands: Some follicular hyperplasia in the periphery centrally, almost wholly degenerated, more or less fibroid in the periphery with

some pigmentary infiltration. Liver: Extensive engorgement spaces in the center of lobule dilated, liver cells small, and atrophic throughout, most so in the center of lobule. Extensive fatty infiltration and foci of fatty necrosis, moderate degree of interstitial fibrous tissue increase between individual lobules and groups of lobules, scattered foci of typical tubercle formation. Spleen: Considerable engorgement, malpighian bodies dense clearly outlined, numerous foci of typical tubercle formation in all stages of degeneration. Kidney: Moderate engorgement, slight diffuse increase of interstitial fibrous tissue most marked about the blood vessels, and to some extent about the glomeruli walls of the blood vessels, thickened tubular epithelium shallow, lumen wide, contains more or less granular debris, some apparent increase of nuclei in the glomeruli. Small intestines: Extensive tubercle formation in all stages of formation and degeneration infiltrating all the walls, surface of the ulcers irregular and superficial portions more or less granular and degenerated, edges nodular, proliferation and degeneration of the mucosal epithelium.

214. Male. Age 76. First admission. Psychosis: Secondary dementia. No report.

Duration of psychosis: More than twenty years.

Cause of death: Intestinal gangrene.

Clinical report: Admitted February, 1885. Nothing known of patient prior to admission. The development of dementia has been progressive for years; was actively employed about the institution. In May, 1906, he was taken with a mild enterocolitis, followed by progressive emaciation and physical weakening. Some tenderness over the abdomen; stools muco purulent, occasionally streaked with blood.

Pathological report: Fatty infiltration of the heart, sclerosis and calcareous infiltration of the mitral and aortic valves, chronic myocarditis, dilatation of the aorta, extensive arterio-sclerosis, atheromatosis and some calcareous infiltration of the arteries, chronic bilateral pleuritic adhesions, marginal pulmonary emphysema, chronic tuberculosis of the lung, chronic bronchitis, hyperplasia, pigmentation and caseation of the bronchial glands, haemoperitoneum, gangrene of the greater portion of the ileum, caecum, and lower portion of the ascending colon, thrombosis of a branch of the superior mesenteric artery whose arterial supply the above gangrenous part of the intestine, chronic gastritis, cirrhosis of the liver, chronic nephritis, chronic perispleenitis, cystic thyroid gland, chronic pancreatitis, hyperplasia and caseation of the retroperitoneal lymphatic glands, arcus senilis, chronic pachy and leptomeningitis, increase of subdural fluid, tumor of the falx cerebri, tumor of the corpus callosum.

Microscopical report: Heart: Moderate degree of fatty infiltration of the right ventricle, extensive fibrous tissue increase, some perivascular round cell infiltration. Artery: Moderate degree of endarteritic proliferation of the intima. Lung: Dilatation of many of the vesicles with thinning and rupture of some of the

alveolar walls, diffuse perivascular and peribronchial blackish pigmentary infiltration, typical tubercle foci and areas. Bronchial glands: Hyperplasia of the lymph follicles, some blackish pigmentary infiltration, extensive typical tubercle formation, some tending to become fibroid. Pituitary body: Some engorgement, dilatation of a few alveoli at the junction of the two bodies, forming cystlike spaces. Thyroid gland: Diffuse increase of interstitial fibrous tissue between individual vesicles and groups of vesicles, dilatation of many of the vesicles, colloid content of many of the smaller vesicles more or less infiltrated with epithelial cells. Adrenal: Some vascular engorgement, foci of round cell infiltration. Pancreas: Extensive increase of interstitial fibrous tissue, dilatation of some of the alveoli. Liver: Extensive engorgement, central liver cells of the lobule small atrophic and pigmentary, slight increase of periportal tissue and round cell infiltration. Spleen: Moderate engorgement, some hyperplasia of the malpighian bodies: Kidneys: Fibroid thickening of the capsule, extensive diffuse infiltration with fibrous tissue and masses of round cells, extensive fibrosis of the glomerular capsule, increase nuclear content of the glomeruli, walls of the blood vessels thickened, some vascular engorgement. Nerve tissue: Moderate chromatolysis, perivascular spaces well marked, central canal of the cord filled with cells, some infiltration with epithelial cells of the gelatinous substance. Dura: Nodule masses of the spindle-shaped cells varying in density with numerous concentric hyaline bodies scattered through its substance. Tumor: Diffuse loosely arranged stroma, foci of loosely arranged large round cells, numerous engorged blood vessels, thin walled, poorly supported, whole infiltrating the adjoining nervous tissue.

SENILE DEMENTIA.

209. Female. Age 83. First admission. Psychosis: Senile dementia. Reported restless, incoherent in talk and action. Sleepless, vulgar, vicious, at times violent, talks of living in hell, wants to get back to heaven, imagines some of the family are abusive to her, memory bad.

Duration of psychosis: Three years and over.

Cause of death: Myocarditis and senile debility.

Clinical report: Admitted December, 1903. Age 80. Married, two children, with a psychosis of senile dementia, periods of more or less excitement interchanging with the stupor of dementia which progressively increased. Physical condition was frail and underwent gradual exhaustion.

Pathological report: Chronic pericardial adhesions, cardiac hypertrophy and dilation, chronic myocarditis, fatty infiltration of the heart, sclerosis of the mitral and aortic valves, the latter also atheromatous and calcareous, dilatation of the aorta, extensive arterio-sclerosis, atheromatous and calcareous infiltration of the arteries, chronic pleuritic adhesions bilaterally, marginal pulmonary

congestion, chronic bronchitis, hyperplasia and pigmentation of the bronchial glands, cirrhosis of the liver, chronic nephritis, purulent pyelitis, dilatation of the ureters, prolapse of the uterus, hypertrophy of the uterine cervix, cystic thyroid gland, hyperplasia of the mesenteric gland, chronic haemorrhagic pachymeningitis, chronic leptomeningitis, chronic external hydrocephalus, atrophy of the right optic nerve, cataract of the left eye, cicatricial contraction of the right eye, cerebral atrophy.

Microscopical report: Heart: Extensive increase of interstitial fibrous tissue, extensive fatty infiltration of the right ventricle. Artery: Extensive endarteritic proliferation of the intima irregular atheromatous degeneration of its deeper portion, thickening of the media, some perivascular round cell infiltration of the external coat, foci of calcareous infiltration. Lung: Diffuse irregular dilatation of many of the vesicles with thinning and rupture of some of their walls, general vascular engorgement, areas of typical tubercle formation, mostly about the bronchioles, more or less fibroid and infiltrated with blackish pigment, bronchioles filled with desquamated epithelial cells, some vesicles filled with homogeneous material, containing a variable number of leucocytes. Thyroid gland: Diffuse increase of interstitial fibrous tissue, walls of the blood vessels thickened, a few vesicles dilated, many of the smaller ones infiltrated with epithelial cells, malpighian bodies small, many of the blood vessels almost occluded. Liver: Diffuse increase of interlobular fibrous tissue with more or less round cell infiltration in the portal fissures, walls of the blood vessels thickened, lumen narrowed, liver cells small and rather atrophic. Pancreas: Moderate increase of interstitial fibrous tissue into and between the lobules. Adrenals: Small scattered foci of round cell infiltration protoplasm of many of the adrenal cortex cells vacuolated and staining irregularly. Appendix: Hyperplasia of the lymph follicles, thickening of the mucosa, considerable fatty tissue accumulation in the submucosa. Kidney: Fibroid thickening of the capsule, extensive diffuse infiltration of the kidney substance with inflammatory fibrous tissue and cells, at places forming dense masses, most of the glomeruli show more or less fibrous, some are whorl-like, some tubules dilated, epithelium in many granular and indistinct, nucleus not visible, many filled with hyaline material, walls of the blood vessels thickened, proliferation of the pelvic mucosal epithelium, extensive infiltration of the submucous tissue with round cells and inflammatory tissue.

ORGANIC DEMENTIA.

212. Male. Age 76. First admission. Psychosis: Organic dementia. Reported having a mental condition of moderate general weakening, memory being especially defective, disposition as a rule good, with periods of despondency. Duration of psychosis: Two years.

Cause of death: Chronic myocarditis.

Clinical report: Admitted April, 1904, with a psychosis of organic dementia beginning one week prior to admission. Cause is given as an apoplectic stroke, the date of which is not reported. On admission there was fairly right hemiplegia, motor aphasia, speech being limited to yes and no, indistinctly pronounced, leg paralysis recovered so that the patient was able to walk with the assistance of a cane, pronounced cardiac hypertrophy, with some arrhythmia and increased pulse tension, periods of dyspnoea convulsions of the grand mal type at irregular intervals but not accompanied by signs of exaggeration of the paralysis following the convulsions. A few days before death, following a convulsion, there was a general failure of health and strength, with more marked cardiac arrhythmia and dyspnoea. Death was sudden.

Pathological report: Some muscular atrophy of right side, extensive cardiac hypertrophy and some dilatation, chronic myocarditis, slight sclerosis of the mitral and aortic valves, dilatation of the aorta, extensive arterio-sclerosis, numerous atheromatous ulcers of the aorta with a granulation deposit, firm pleuretic adhesions, right bilateral hydrothorax, slight pulmonary emphysema, a few small tubercular nodules, hydroperitoneum, cirrhosis of the liver, chronic nephritis, chronic pancreatitis, hyperplasia of the spleen, general cerebral atrophy, thrombosis of the left anterior cerebral artery, complete destruction of the whole of the left frontal lobe except a small portion of the third frontal convolution, the ascending frontal convolution, a small portion of the posterior part of the first frontal convolution and about half of it on its mesial surface.

Microscopical report: Heart: Extensive increase of interstitial fibrous tissue most marked in the perivascular spaces. Lung: Extensive engorgement of the alveolar capillaries, some of the vesicles dilated and walls thinned, some of the bronchioles filled with epithelial cells, extensive perivascular and peribronchial blackish pigmentary infiltration. Adrenal: Intense engorgement, small scattered foci of round cell infiltration. Spleen: Extensive thickening of the capsule, almost to hyaline appearance, walls of the blood vessels extensively thickened, lumen narrowed, malpighian bodies dense, diffuse increase of lymph-corpuscles. Liver: Extensive venous engorgement, intercellular spaces wide and filled with blood. Liver cells small and atrophic, slight increase of fibrous tissue in some of the portal spaces. Kidneys: Extensive diffuse infiltration with inflammatory tissue, at places forming dense fibrous masses, at others more cellular, most of the tubular epithelium shallow, lumen wide, containing more or less granular debris and some desquamated epithelial cells, some dilated into cystlike spaces, some filled with hyaline material, especially in the medullary portion; most of the glomeruli small, more or less fibroid, some whorl-like, walls of the blood vessels extensively thickened.

PRIMARY DEMENTIA.

221. Male. Age 38. First admission. Psychosis: Primary dementia. Reported as feeble-minded, intemperate, with a mania for breaking glass.

Duration of psychosis: Not given.

Cause of death: Chronic pericarditis and myocarditis.

Clinical report: Admitted August, 1903, with a psychosis of primary dementia. Occupation, laborer. Reported feeble-minded all his life. After admission there were periods of mild excitement and several attempts at suicide. Physical health was good until early in July, 1906, when oedema of the feet appeared and later general anasarca, dyspnoea, etc.

Pathological report: Obliteration of the pericardial cavity by firm adhesions, extensive cardiac hypertrophy and dilatation, sclerosis of the mitral and aortic valves, chronic myocarditis, general arterio-sclerosis, aortic dilatation, bilateral pleuritic adhesions, obliteration of the left cavity, localized acute pleurisy of the right side, pyothorax, pulmonary oedema, hyperplasia of the bronchial glands, cystic thyroid, perihepatitis, chronic venous congestion of the liver, chronic gastritis, chronic nephritis, hydroperitoneum, chronic meningitis, cerebral atrophy, hypertrophy of the prostate gland, general anasarca.

Microscopical report: Nerve tissue: Intense engorgement, some round cell infiltration of the perivascular spaces. Lung: Intense engorgement, alveoli contain some leucocytes and desquamated epithelial cells some diffuse alveolar pigmentary infiltration. Thyroid: Moderate increase of fibrous tissue dilatation of the vesicles, some epithelial cell infiltration of the small vesicles. Heart: Extensive interstitial myocarditis, extensive epicardial round cell infiltration, muscle fibres swollen, epicardium swollen and vessels intensely engorged, a layer of granulation tissue in early formation between the two layers of the pericardium, the external layer swollen and densely infiltrated with round cells in its deeper portion, while its outer portion is more fibroid. Artery: Moderate endarteritic proliferation of the intima. Pancreas: Extensive increase of fibrous tissue, many lobules and alveoli displaced by fat tissue. Gall bladder: Proliferation of the mucosal epithelium round cell infiltration of the submucosal tissue with some fibrous tissue increase. Pituitary body: Intense engorgement increase of fibrous tissue. Liver: Intense engorgement, necrosis of the central cells, diffuse fibrous tissue increase. Spleen: Intense engorgement, malpighian bodies small, diffuse leucocytic increase. Kidneys: Extensive engorgement, tubular epithelium shallow, lumen wide and filled more or less with granular material, moderate increase of fibrous tissue, most marked subcapsular, some granular debris in many of the glomeruli, scattered foci of round cell infiltration, walls of the blood vessels somewhat thickened.

NOT INSANE.

192. Male. Age 27. Single. Occupation, hospital attendant.

Clinical report: Was an attendant at the hospital for nearly two months. About two weeks before death he complained some of having a cold and cough; was given a bottle of cough medicine and nothing more was reported. On the afternoon preceding death he went to the city, spent the evening at the theater, returning home about 11:30 and retired about 12:30 a. m., apparently all right. About 4 a. m. his roommate awakened and hearing him breathing heavily tried to awaken him, but failed. The physician was called and found him comatose with stertorous breathing, weak pulse, pupils contracted. The stomach pump was used, coffee and stimulants were administered, but the coma deepened until death supervened at 9 a. m. As regards his previous health it was learned that about three years before he had gone West on account of pulmonary trouble, and while there underwent several aspirations of the left pleural cavity, but was never confined to his bed.

Pathological report: Chronic adhesions between the pleura and pericardium, slight hydropericardium, dilatation of the right side of the heart, extensive chronic bilateral pleuritic adhesions obliterating the left pleural cavity, and almost the whole of the right; extensive miliary and nodular pulmonary tuberculosis and anthracosis, chronic bronchitis, hyperplasia and pigmentation of the bronchial glands, chronic peritonitic adhesions, involving the liver, spleen and intestines; extensive tubercular ulcerations of the small intestines, hyperplasia of the spleen, hyperplasia of the mesentric glands, left testicle smaller than the right.

Microscopical report: Nerve tissue: A few cells show slight chromatolysis, central canal of cord filled with epithelial cells. Heart: Slight fatty infiltration of the right ventricle, slight perivascular increase of fibrous tissue. Aorta: Slight endarteritic proliferation of the intima. Lung: Diffuse infiltration with typical tubercular nodules in all stages of formation and degeneration, some tending to become fibroid, extensive fibroid thickening of the pleura. Bronchial glands: Hyperplasia of the lymph follicles, extensive blackish pigmentary infiltration. Thyroid gland: Colloid content of the smaller vesicles more or less infiltrated with epithelial cells. Pituitary body: A few cystlike spaces at the junction of the two portions filled with hyaline material. Adrenal: Moderate degree of focal round cell infiltration of the medullary portion. Spleen: Considerable engorgement, hyperplasia of the malpighian bodies, scattered typical tubercular nodules in various stages of degeneration. Liver: Moderate dilatation of the central intercellular spaces, atrophy and brownish yellow pigmentation of the corresponding cells, slight increase of fibrous tissue in the portal spaces, scattered foci of typical tubercular formation. Kidney: Moderate diffuse increase of fibrous tissue, most marked in the subcapsular region. Intestines:

Extensive hyperplasia of the lymph follicles, extensive typical tubercular infiltration and ulceration involving all the structures.

In summing up the most prominent of the various pathological conditions, it will be seen that the various structures and organs showed definite visible structural alterations as follows:

Cranial bones.....	10
Meninges	37
Cerebrospinal fluid.....	31
Brain:	
Atrophy	23
Oedema	2
New growth.....	2
Softening	6
Sclerosis	5
Hemorrhage	2
Ventricles	14
Choroid plexus.....	12
Ependyma	14
Spinal cord.....	5
Cranial nerves.....	3
Thyroid gland.....	16
Pericardium	16

List of gross specimens added to the museum collection:

1. Perforation of the bladder.
2. Extensive tubercular cavity formation.
3. Extensive pulmonary anthracosis, with tubercular involvement.
4. Carcinoma of the prostate.
5. Pulmonary infarct.
6. Pulmonary thrombus.
7. Tuberculosis of the caecum and appendix.
8. Carcinoma of the caecum and appendix.
9. Acute pericarditis.

10. Extreme dilatation of the lateral ventricles.
11. Rupture of the aorta.
12. Hypertrophy of the heart, with associated sclerotic kidney.
13. Miliary tuberculosis of the lung of a guinea-pig following intra-peritoneal injection of purulent material from a psoas abscess.
14. Perforated vermiform appendix.
15. Angiosarcoma of the brain.
16. Acute myocarditis.
17. Pouch in the interventricular septum of the heart protruding into the right auriculoventricular septum.
18. Multiple uterine fibroids.
19. Uniting fracture of a rib.
20. Enchondroma of the cranial cavity.
21. Cerebral hemisphere of a case of enchondroma of the brain.
22. Extensive chronic nephritis, with cyst formation.
23. Gastric carcinoma.
24. Osteochondromatous deposit in the pleura.
25. Extensive cardiac hypertrophy, with chronic pericardial adhesions obliterating the pericardial cavity.
26. Kidney of the latter.
27. Chronic nephritis.
28. Tumor of the corpus callosum.
29. Thrombosis of the superior mesenteric artery.
30. Kidney of a case of intracranial chondroma, one of which is represented almost wholly by a mass of fat.
31. Thrombosis of the anterior cerebral artery and softening of the brain supplied by it.
32. Thrombosis of the middle cerebral artery and softening of the portion of the brain supplied by it.

Cranial bone changes: Cranial bone changes were present in the following cases: Three general paresis, 1 tabo-paresis, 2 epileptic insanity, 2 secondary dementia, 1 senile paranoia, 1 primary dementia. Dural changes in 4 chronic mania, 1 recurrent mania, 1 agitated melancholia, 2 chronic melancholia, 2 recurrent melancholia, 1 circular insanity, 9 epileptic insanity, 5 general paresis, 1 senile paranoia, 1 chronic paranoia, 3 secondary dementia, 2 senile dementia.

Arachnoid changes: In 1 agitated melancholia, 2 acute melancholia, 2 chronic and 2 recurrent melancholia, 4 chronic and 2 recurrent mania, 1 circular insanity, 10 epileptic insanity, 1 senile and 1 chronic paranoia, 4 general and 1 tabo-paresis, 4 secondary and 1 senile dementia.

Cerebrospinal fluid changes: In 1 acute, 2 chronic and 2 recurrent melancholia, 1 each of acute, chronic and recurrent mania, 6 epileptic insanity, 5 general paresis, 3 secondary and 3 senile dementia, 1 each of senile paranoia, circular insanity and tabo-paresis.

General cerebral atrophy: In 6 epileptic insanity, 3 each in chronic mania, secondary dementia, 2 each in general paresis and senile dementia, 1 each in acute, chronic and recurrent melancholia, acute and recurrent mania, circular insanity, tabo-paresis, organic dementia and senile paranoia.

Localized softening: In 2 chronic mania, 1 each of the following—

Acute melancholia, epileptic insanity, general paresis, organic and secondary dementia.

Localized sclerosis: In 2 recurrent melancholia, 1 epileptic insanity and 1 senile paranoia.

Brain tumor: In one epileptic insanity, 1 secondary dementia.

Dilatation of the ventricles: In 1 chronic mania, 2 chronic melancholia, 3 epileptic insanity, 3 general and 1 tabo-paresis, 1 senile paranoia.

Disease of the choroidal plexus: In 5 epileptic insanity, 2 chronic melancholia, and 1 each of the following—Acute and recurrent melancholia, recurrent mania, circular insanity, tabo-paresis, secondary dementia, senile paranoia, and 2 in chronic mania.

Ependymal changes: In 2 chronic, and 1 recurrent mania, 1 acute melancholia, 3 epileptic and 1 circular insanity, 2 general and 1 tabo-paresis.

Pineal gland changes: In 1 chronic mania, and 1 epileptic insanity.

Hemorrhage: In 1 epileptic insanity, 1 secondary dementia.

Cranial nerve involvement: In 2 general paresis, 1 each of agitated melancholia, epileptic insanity, senile dementia.

Eye changes: In 2 general paresis, epileptic insanity, senile dementia, 1 each of recurrent mania, senile paranoia, secondary dementia.

Spinal cord changes: In 1 recurrent mania, 1 tabo-paresis, 1 epileptic insanity.

Thyroid gland: In 5 epileptic insanity, 4 chronic mania, 1 each of agitated melancholia, circular insanity, senile and secondary dementia.

Pericardial affections: In 4 chronic mania, 2 epileptic insanity, 1 each of chronic melancholia, recurrent mania, general paresis, senile paranoia, senile and secondary dementia, chronic paranoia, not insane.

Myocardial changes: In 2 each of chronic mania, general paresis, 1 each in recurrent mania, acute and chronic melancholia, tabo-paresis and epileptic insanity, organic dementia, senile and chronic paranoia.

Endocardial affections: In 1 in each of recurrent mania, acute and recurrent melancholia and general paresis.

Valvular disease: In 3 of each chronic mania, epileptic insanity, secondary dementia, and 1 each in acute and recurrent mania, circular insanity, organic and senile dementia, and 2 in each chronic and acute melancholia and general paresis.

Cardiac hypertrophy: In 5 epileptic insanity, 3 chronic mania, 2 of each chronic and recurrent mania, circular insanity, acute melancholia, general paresis, senile and organic dementia.

Cardiac dilatation: In 3 each of chronic mania, epileptic insanity, 2 in secondary dementia, and 1 in each acute and recurrent mania, acute recurrent and chronic melancholia, 1 in general and tabo-paresis, senile paranoia, senile and organic dementia, 1 not insane.

Fatty infiltration of the heart: In 8 epileptic insanity, and 1 each in acute and chronic mania, acute melancholia and circular insanity, senile paranoia, general paresis and secondary dementia.

Aortic dilatation: In 2 each of chronic mania, secondary dementia, and 1 each of chronic melancholia, recurrent melancholia, senile and organic dementia, senile paranoia.

Aortic rupture: In 1 chronic melancholia.

General arteriosclerosis: In 1 acute, 1 recurrent and 5 chronic mania, 1 each of acute and agitated melancholia, 2 each of chronic and recurrent melancholia, epileptic insanity 10, 4 general paresis, 4 secondary, 1 senile, 1 organic dementia, 1 each of circular insanity, chronic and senile paranoia.

Atheromatosis: In 5 epileptic insanity, 2 each of chronic mania, recurrent melancholia, general paresis, secondary dementia, and 1 each in recurrent mania, acute and chronic melancholia, senile and chronic paranoia, senile and organic dementia.

Pleuritic adhesions on the right side: In 8 epileptic insanity, 4 chronic mania, 2 each of recurrent and chronic melancholia, general paresis, 3 of secondary dementia, and 1 each of recurrent mania, acute and agitated melancholia, circular insanity, senile and organic dementia, senile paranoia and not insane.

Left side in 10 epileptic insanity: Four chronic mania, 3 secondary dementia, 2 each in recurrent mania, acute and chronic melancholia, and 1 each in acute mania, general paresis, senile dementia, senile and chronic paranoia, not insane.

Hydrothorax: In 2 chronic mania, 1 each of acute mania, epileptic insanity, organic dementia.

Empyema: In 1 chronic mania, 1 epileptic insanity.

Lobar pneumonia: In 3 general paresis, 2 chronic mania, 1 each of recurrent mania, acute and chronic melancholia, epileptic insanity.

Hypostatic pneumonia: In 6 epileptic insanity, 1 each of acute and chronic and recurrent mania, acute chronic and acute melancholia, circular insanity, general and tabo paresis, secondary and senile dementia.

Oedema of the lungs: In 3 epileptic insanity, 3 general paresis, 2 chronic mania, 1 each of recurrent mania, chronic and recurrent melancholia.

Pulmonary emphysema: In 1 each of acute, chronic and recurrent melancholia, recurrent mania, general paresis, chronic paranoia, secondary senile and organic dementia, 2 in epileptic insanity.

Pulmonary collapses: In 1 recurrent mania, 1 recurrent melancholia, 1 epileptic insanity, 1 chronic paranoia.

Pulmonary infarct: In recurrent mania and recurrent melancholia.

Pulmonary gangrene: In 2 epileptic insanity, and 1 recurrent mania.

Pulmonary tuberculosis: In 6 epileptic insanity, in 3 chronic mania, 3 secondary dementia, 1 each in recurrent mania, organic dementia, senile paranoia, not insane.

Anthraxis: In 1 epileptic insanity, 1 senile paranoia, and 1 not insane.

Bronchial affections: In 10 epileptic insanity, 3 each recurrent mania, recurrent melancholia, 2 each in general paresis, and 1 secondary dementia, and 1 each in acute mania, acute and chronic melancholia, chronic paranoia, senile dementia, not insane.

Bronchial gland disease: In 9 epileptic insanity, 4 secondary dementia, 3 chronic mania, 2 chronic melancholia, 1 each in acute, agitated and recurrent melancholia, general and tabo paresis, senile dementia, circular insanity, chronic paranoia, not insane.

Peritoneal involvement: In 3 secondary dementia, 1 each of recurrent

mania, recurrent melancholia, circular and epileptic insanity and not insane.

Hydroperitoneum: In 1 epileptic insanity, 1 organic dementia, and 1 senile paranoia.

Pyoperitoneum: In 2 secondary dementia, 1 recurrent mania, 1 recurrent melancholia.

Haemoperitoneum: In 1 circular insanity, 1 secondary dementia.

Perihepatitis: In 2 epileptic insanity, 1 each of chronic mania, recurrent melancholia, secondary dementia, not insane.

Cirrhosis of the liver: In 3 of epileptic insanity, chronic mania, 2 each of general paresis, secondary and senile dementia, and 1 each of recurrent mania, chronic and recurrent melancholia, senile and chronic paranoia, tabo-paresis and organic dementia.

Fatty infiltration of the liver: In 3 epileptic insanity, 1 each of chronic mania, general paresis and organic dementia.

Syphilis of the liver: In 1 epileptic insanity.

Carcinoma of the liver: In 1 chronic mania.

Tuberculosis of the liver: In 1 epileptic insanity.

Cholecystitis: In 1 each of chronic mania, epileptic insanity, senile paranoia.

Cholelithiasis: In 2 epileptic insanity, 1 circular insanity and 1 secondary dementia.

Perisplenitis: In 1 each of chronic and recurrent mania, epileptic insanity, secondary dementia and not insane.

Portal phlebitis: In 1 recurrent melancholia.

Splenic affections: In 6 epileptic insanity, 4 general paresis, 3 chronic mania, 2 recurrent melancholia and 1 each of chronic melancholia, circular insanity, organic and secondary dementia, tabo-paresis and not insane.

Adrenal disease: In 2 chronic mania epileptic insanity.

Pancreatic disease: In 2 chronic mania, 2 epileptic insanity, 1 each of chronic melancholia, circular insanity, secondary and organic dementia.

Kidney disease: In 8 epileptic insanity, 5 chronic mania, 5 general paresis, 4 secondary dementia, 3 recurrent melancholia, 2 chronic melancholia, and 1 each in acute and recurrent mania, acute and agitated melancholia, senile and organic dementia, senile and chronic paranoia.

Urethral involvement: In 1 each of epileptic and circular insanity in senile dementia.

Nephrolithiasis: In 1 epileptic insanity.

Bladder disease: In 1 each of chronic mania, circular insanity and secondary dementia.

Urethral stricture: In one circular insanity.

Ovarian disease: In 4 chronic mania, in 3 epileptic insanity, and 1 each acute and recurrent mania, recurrent melancholia, and secondary dementia.

Tubule disease: In one each of chronic mania, epileptic insanity, secondary dementia.

Uterine affections: In 2 chronic mania, 2 epileptic insanity, and 1 each in acute mania, agitated and recurrent melancholia, tabo-paresis and senile dementia.

Peritoneal involvement: In 1 each epileptic insanity, chronic mania and secondary dementia.

Prostatic disease: In chronic melancholia, 1 general paresis and 1 senile paranoia.

Testicular disease: In 2 epileptic insanity, 1 not insane.

Gastritis: In 6 epileptic insanity, 3 general paresis, 2 acute melancholia, 1 each in chronic and recurrent melancholia, chronic mania and secondary dementia.

Gastric carcinoma: In 1 each epileptic insanity, senile and chronic paranoia.

Intestinal disease: In 5 epileptic insanity, 2 secondary dementia, 1 each of acute melancholia, general paresis, not insane.

Appendix disease: In 4 epileptic insanity, 1 chronic mania and 1 secondary dementia.

Mesenteric gland involvement: In 5 epileptic insanity, 3 secondary dementia, 3 general paresis, 2 chronic mania, and 1 each of acute and agitated melancholia, senile dementia, senile and chronic paranoia, not insane.

Mammary gland disease: In 1 chronic mania.

Decubitus: In 3 epileptic insanity, 2 chronic mania, 1 each of acute mania and melancholia, general paresis and tabo-paresis, secondary dementia.

General lymphatic gland involvement: In 2 each of chronic mania and general paresis.

Acute suppurative otitis media: In 1 general paresis.

Persistent thymus: In 3 epileptic insanity, 1 chronic melancholia.

Respectfully submitted,

CHARLES F. NEU, M. D.,
Pathologist.

MOVEMENT OF POPULATION FOR THE FISCAL YEAR 1905-1906.

RESULTS.	Men.	Women.	Total.
Number of patients at beginning of the year.....	912	1158	2070
Admitted during the year.....	262	179	441
Whole number under treatment.....	1,174	1,528	2,702
Discharged as recovered.....	99	113	212
Discharged as improved.....	72	50	122
Discharged as unimproved.....	25	13	38
Discharged as not insane.....	1		1
Died.....	100	62	162
Remaining at close of the year.....	877	1,099	1,976
Per cent. of recovered of whole number under treatment	8.432	7.395	7.846
Per cent. recovered to number admitted.....	37.786	63.128	48.072
Per cent. died of whole number treated.....	8.518	4.057	5.958
Daily average number actually present.....	847.038	1,011.848	1,858.886

ADMISSIONS, DISCHARGES AND DEATHS FROM BEGINNING OF
THE HOSPITAL, 1848.

RESULTS.	Men.	Women.	Total.
Admitted.....	13,423	11,458	24,881
Discharged as recovered.....	5,483	4,727	10,210
Discharged as improved.....	2,095	2,107	4,202
Discharged as unimproved.....	2,438	1,519	3,957
Discharged as not insane.....	37	29	66
Discharged as feeble-minded.....		6	6
Died.....	2,480	1,956	4,436
Total number discharged and died.....	12,533	10,344	22,877
